

Chapter 9

Bonding II: Molecular Geometry and Bonding Theories

Dr. A. Al-Saadi

Preview

- The **VSEPR** model
 - Molecular geometry (going from two-dimensional "Lewis structure" to three-dimensional "VSEPR model" shapes)
 - Polarity
- Valence bond theory
- Hybridization of atomic orbitals
- Molecular orbital (MO) theory
 - MO energy diagram
 - Delocalization of orbitals

Dr. A. Al-Saadi

Chapter 9 Section 1

Molecular Geometry

- The **V**alence **S**hell **E**lectron-**P**air **R**epulsion (**VSEPR**) model helps to determine the molecular structure and geometry in 3-D in the space.
- Even though it is not as precise as other models, the VSEPR model is a simple, extremely useful model.
- The **VSEPR** model deals with molecules of the general type:

$$AB_x$$
 where the central atom **A** is surrounded by **x** of **B** atoms, and **x** can take values from 2 to 6.

Dr. A. Al-Saadi

Chapter 9 Section 1

Molecular Geometry

- The **VSEPR** model is based on the assumption that:

Bonding and nonbonding electron pairs in the valence shell are positioned around the central atom such that *electron-pair repulsions* are minimized.
- A central atom can be surrounded by:

<ul style="list-style-type: none"> Bonding pairs (B) <ul style="list-style-type: none"> can be single, double or triple bonds Lone pairs (E) 	}	Electron domains
--	---	------------------

$$AB_xE_y$$

where the number of electron domains = $x + y$

Dr. A. Al-Saadi

Chapter 9 Section 1

Counting Electron Domains

Chapter 9 Section 1

Deviation from Ideal Bond Angles

- Multiple bonds (double and triple) repel more strongly than single bonds because they have more electron density.
- The order of deviation from ideal angles is:

single bond < double bond < triple bond < lone pair

→
Repulsion increases

Dr. A. Al-Saadi 33

Chapter 9 Section 1

Deviation from Ideal Bond Angles

single bond < double bond < triple bond < lone pair

→
Repulsion increases

Dr. A. Al-Saadi 34

Chapter 9 Section 1

Lewis structure → Electron-domain geometry → Molecular geometry

Examples: SO₂

A double bond should be counted as one electron domain.

Electron-domain geometry: trigonal planar.

Class: AB₂E

Molecular geometry: Bent or V-shaped.

Dr. A. Al-Saadi 35

Chapter 9 Section 1

Lewis structure → Electron-domain geometry → Molecular geometry

Examples: CO₃²⁻

Lewis structure

There are 3 electron domains on the central atom.

Electron-domain geometry: trigonal planar

Class: AB₃

Molecular geometry: trigonal planar

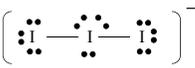

Dr. A. Al-Saadi 36

Chapter 9 Section 1

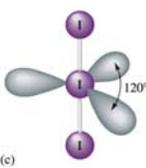

Lewis structure → Electron-domain geometry → Molecular geometry

Examples: I_3^-

- Extra valence electrons, if any, must go to the central atom.
 $(I_3^-) \quad (21+1)e^- - 4e^- = 18e^-$

Electron-domain geometry: trigonal bipyramidal.
Class: AB_2E_3

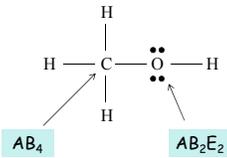

(c) Linear

Molecules with More Than One Central Atom

- CH_3OH

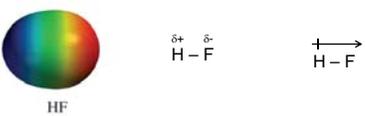

Dr. A. Al-Saadi 38

Chapter 9 Section 2

Predicting Polarity from Molecular Geometry

- When the correct geometry is obtained for a given molecule, the polarity of that molecule can be predicted.

HF

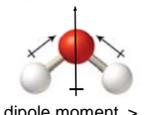

- Bond dipoles are **vectors** and therefore are **additive**.

Dr. A. Al-Saadi 39

Chapter 9 Section 2

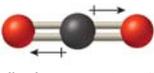

Predicting Polarity from Molecular Geometry

- Bond dipoles are **vectors** and therefore are **additive**.
- Only the bonding pairs of electrons play a role in determining the polarity of a molecule.

H_2O dipole moment > 0

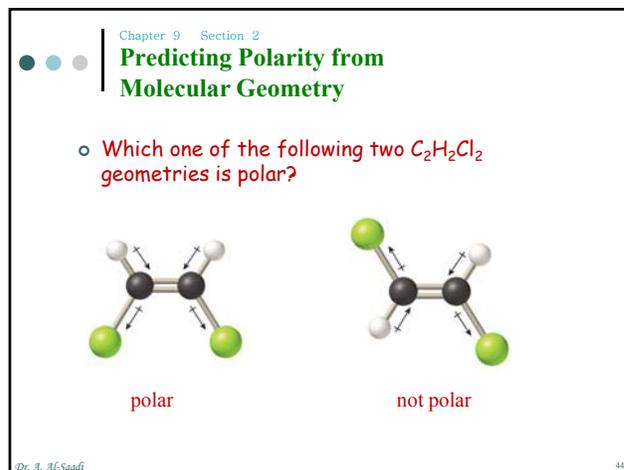

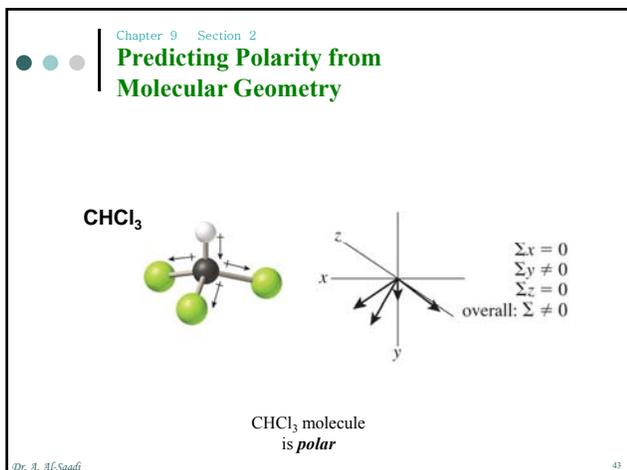

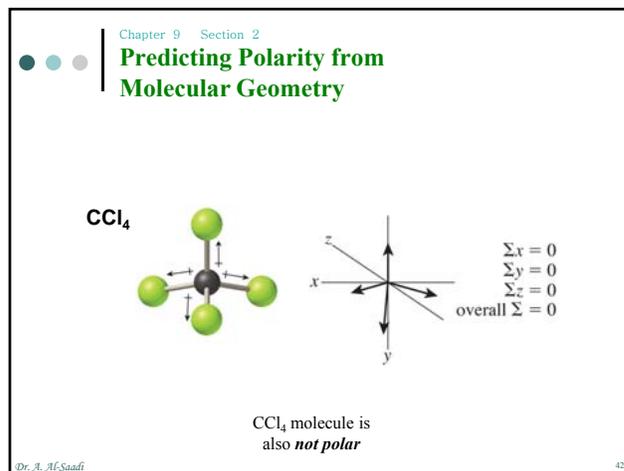

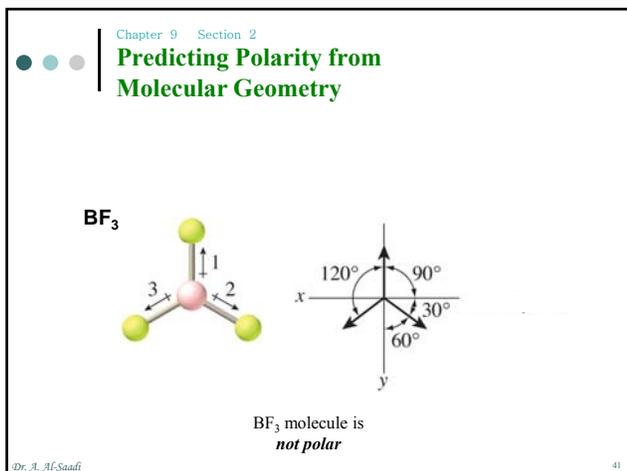

H_2O molecule is **polar**

CO_2 dipole moment $= 0$

CO_2 molecule is **not polar**, although it has polar bonds

Dr. A. Al-Saadi 40

Chapter 9 Section 2

Predicting Polarity from Molecular Geometry

- Which one of the following geometries are polar?

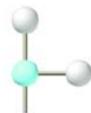

Trigonal planar

not polar

Pyramidal

polar

T-shaped

polar

Dr. A. Al-Saadi

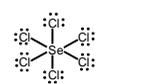

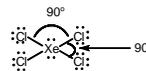

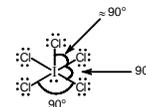

45

Chapter 9 Section 1 and 2

Exercises

94. Predict the molecular structure (including bond angles) for each of the following. (See Exercises 89 and 90.)

- ICl_3
- XeCl_4
- SeCl_4

98. Write Lewis structures and predict whether each of the following is polar or nonpolar.

- HOCN (exists as $\text{HO}-\text{CN}$)
- COS
- XeF_2
- CF_2Cl_2

Dr. A. Al-Saadi

46

Chapter 9 Section 3

Valence Bond Theory

- Do you still remember the shapes of atomic orbitals?
 - $1s$ and $2s$ orbitals.
 - $2p$ and $3p$ orbitals.

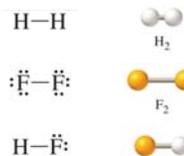

Dr. A. Al-Saadi

47

Chapter 9 Section 3

Valence Bond Theory

- Valence bond theory** explains the differences in the properties of various covalent bonds.

- Although Lewis model is useful, but it can't account for different bond lengths and bond strengths of different molecules.

	Bond Length (Å)	Bond Enthalpy (kJ/mol)
H_2	0.74	436.4
F_2	1.42	150.6
HF	0.92	568.2

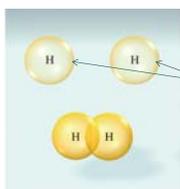

Dr. A. Al-Saadi

48

Chapter 9 Section 3

Valence Bond Theory

- According to *valence bond theory*, atoms form a covalent bond when *an atomic orbital* on one atom *overlaps* with *an atomic orbital* of another atom.

Each atomic orbital must have:
a single unpaired electron.
(shown as transparent orbitals)

Furthermore, the two electrons in
the two atomic orbitals must have
opposite spins.

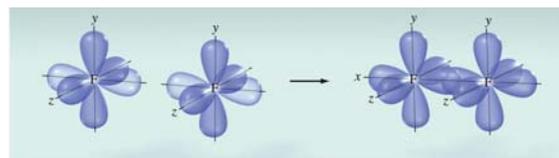

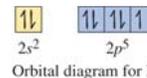

Dr. A. Al-Saadi

49

Chapter 9 Section 3

Valence Bond Theory

- According to *valence bond theory*, atoms form a covalent bond when *an atomic orbital* on one atom *overlaps* with *an atomic orbital* of another atom.

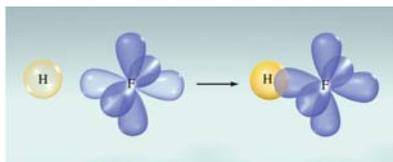

Dr. A. Al-Saadi

50

Chapter 9 Section 3

Valence Bond Theory

- According to *valence bond theory*, atoms form a covalent bond when *an atomic orbital* on one atom *overlaps* with *an atomic orbital* of another atom.

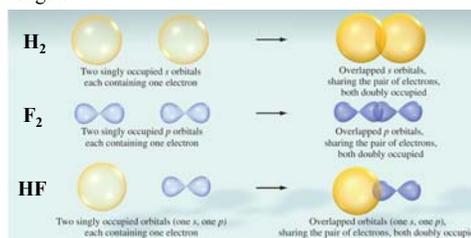

Dr. A. Al-Saadi

51

Chapter 9 Section 3

Valence Bond Theory

- According to quantum mechanics (Chapter 6), the size, shape and energy of 1s and 2p orbitals are different. Therefore, the bonds in H₂, F₂ and HF vary in strength and length.

Dr. A. Al-Saadi

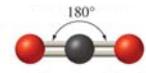

52

Chapter 9 Section 4

Hybridization of Atomic Orbitals

Can you apply *valence bond theory* to the CO_2 molecule?

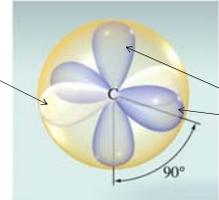

From VSEPR model, CO_2 is linear (AB_2 class).

Actual bond angle is 180°

From the C atom electron configuration, there are two singly occupied p orbitals.

Bond angle should be 90° .

Valence bond theory doesn't work in this case!

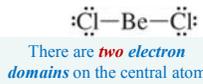

Dr. A. Al-Saadi 53

Chapter 9 Section 4

Hybridization of Atomic Orbitals

Can you apply *valence bond theory* to the BeCl_2 molecule?

From VSEPR model, BeCl_2 is again linear (AB_2 class). Moreover, experimental observations show that both Be-Cl bonds are identical.

There are *two electron domains* on the central atom

Be $\begin{array}{|c|} \hline \uparrow\downarrow \\ \hline 2s^2 \\ \hline \end{array}$ $\begin{array}{|c|c|c|} \hline & & \\ \hline 2p \\ \hline \end{array}$

Cl $\begin{array}{|c|} \hline \uparrow\downarrow \\ \hline 3s^2 \\ \hline \end{array}$ $\begin{array}{|c|c|c|} \hline \uparrow\downarrow & \uparrow\downarrow & \uparrow \\ \hline 3p^5 \\ \hline \end{array}$

The Be atom doesn't have singly occupied atomic orbitals, so the valence bond theory can't be applied in this case!

Hybridization "mixing of atomic orbitals" helps much in understanding many experimental observations that couldn't be explained with valence bond theory.

Dr. A. Al-Saadi 54

Chapter 9 Section 4

Hybridization of Atomic Orbitals

$\text{:}\ddot{\text{Cl}}\text{--Be--}\ddot{\text{Cl}}\text{:}$

Be $\begin{array}{|c|} \hline \uparrow\downarrow \\ \hline 2s^2 \\ \hline \end{array}$ $\begin{array}{|c|c|c|} \hline & & \\ \hline 2p \\ \hline \end{array}$ • No unpaired electrons

Electron is *promoted* from $2s$ to $2p$ orbitals

Be* $\begin{array}{|c|} \hline \uparrow \\ \hline 2s^1 \\ \hline \end{array}$ $\begin{array}{|c|c|c|} \hline \uparrow & & \\ \hline 2p^1 \\ \hline \end{array}$ • Now Be has two singly occupied atomic orbitals and can form two bonds

Excited Be atom

But one problem is still there!

Dr. A. Al-Saadi 55

Chapter 9 Section 4

Hybridization of Atomic Orbitals

$\text{:}\ddot{\text{Cl}}\text{--Be--}\ddot{\text{Cl}}\text{:}$

Although the Be atom can now form two bonds, but from the above diagram those two bonds are different.

Experiment, however, shows that the two Be-Cl bonds are *identical!* Thus, some extra treatments should be done!

Dr. A. Al-Saadi 56

Chapter 9 Section 4

sp Hybridization

- Recall that :
 - Orbital shapes (boundary surfaces) are pictorial representations of wave functions.
 - Wave functions are mathematical functions.
 - Mathematical functions can be *combined*.
- Thus, the atomic orbitals on an atom mix themselves in order to form new **hybrid orbitals** that are identical in shape, energy, and size.

Be* $2s$ $2p$ $2p$ $2p$ sp sp $2p$ $2p$ Non-hybrid orbitals

Dr. A. Al-Saadi 57

Chapter 9 Section 4

sp Hybridization

Be* $2s$ $2p$ $2p$ $2p$ sp sp $2p$ $2p$ Non-hybrid orbitals

Before hybridization After hybridization

- The new two sp orbitals are identical in shape, size and energy.

Dr. A. Al-Saadi 58

Chapter 9 Section 4

sp Hybridization

Be* sp sp $2p$ $2p$

- The two sp orbitals, each with one electron, point in opposite directions inline with one another. This results in an angle of 180° .

Dr. A. Al-Saadi 59

Chapter 9 Section 4

sp Hybridization

2Cl $3s^2$ $3p^5$ $3p^5$ $3p^5$ + Be* sp sp $2p$ $2p$ \rightarrow BeCl₂

- Each hybrid sp orbital overlaps with a $3p$ singly occupied atomic orbital and the angle formed is 180° . **Hybridization** accounts very well for the linear geometry of BeCl₂.

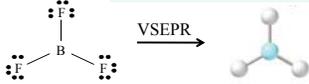

Dr. A. Al-Saadi 60

Chapter 9 Section 4

sp^2 Hybridization

There are **three electron domains** on the central atom

Let's try the same approach with BF_3 .

• trigonal planar
• all bonds equivalent

B: $2s^2$ (one pair), $2p^1$ (one unpaired)

• only 1 unpaired electron available, while 3 bonds are there!

Electrons promotion

B*: $2s^1$ (one unpaired), $2p^2$ (two unpaired)

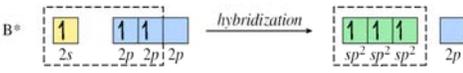

• two types of overlap with 2s and 2p. So hybridization is required.

Dr. A. Al-Saadi 61

Chapter 9 Section 4

sp^2 Hybridization

The next step is **hybridizing** "mixing" the 2s orbital and 2p orbitals.

B*: $2s$ (one pair), $2p, 2p, 2p$ (one unpaired)

hybridization

sp^2, sp^2, sp^2 (three unpaired), $2p$ (one unpaired)

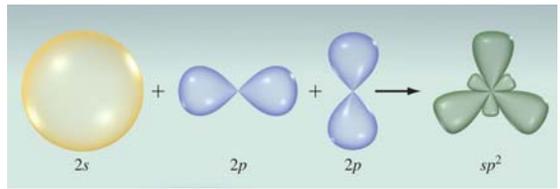

The new three hybrid sp^2 orbitals are identical in shape, size and energy.

Dr. A. Al-Saadi 62

Chapter 9 Section 4

sp^2 Hybridization

The new three hybrid sp^2 orbitals are identical in shape, size and energy and are 120° apart from each other.

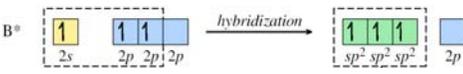

$2s$ + $2p$ + $2p$ → sp^2

Dr. A. Al-Saadi 63

Chapter 9 Section 4

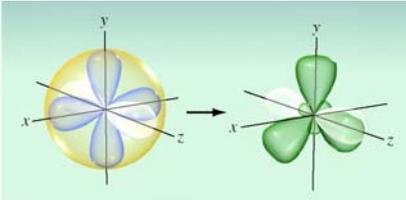

sp^2 Hybridization

B*: $2s$ (one pair), $2p, 2p, 2p$ (one unpaired)

hybridization

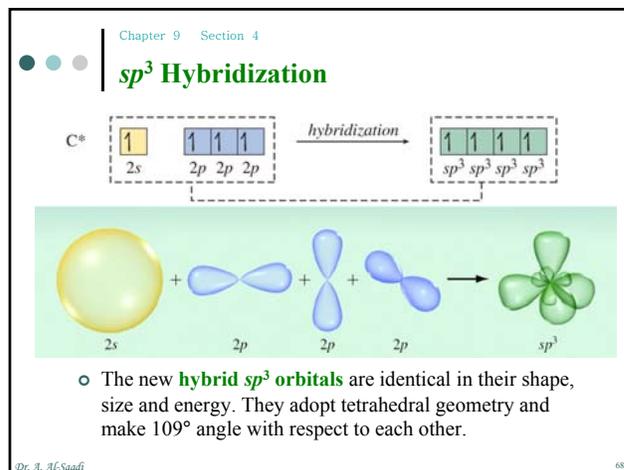

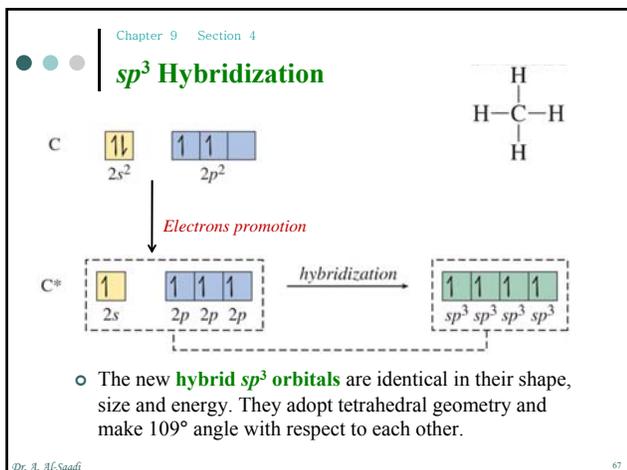

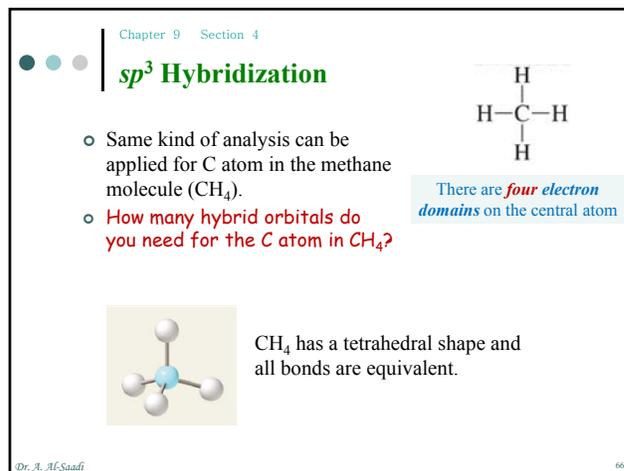

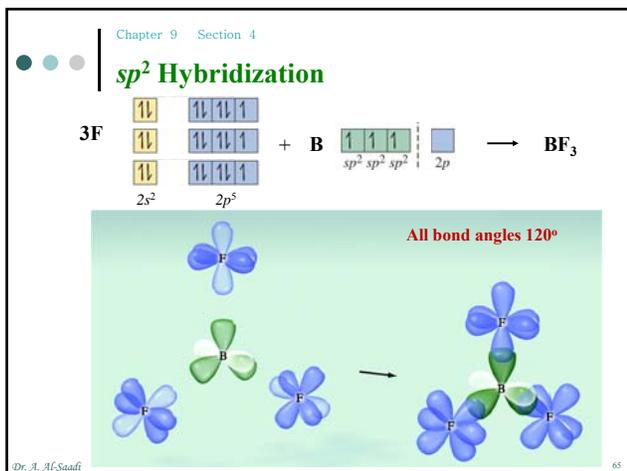

sp^2, sp^2, sp^2 (three unpaired), $2p$ (one unpaired)

• The three hybrid sp^2 orbitals facilitate the trigonal planar geometry.

• There are still one p unhybrid orbital not involved in the bonding process.

Dr. A. Al-Saadi 64

Chapter 9 Section 4

sp^3 Hybridization

$4H \begin{matrix} \uparrow \\ \uparrow \\ \uparrow \\ \uparrow \\ 1s^1 \end{matrix} + C \begin{matrix} \uparrow & \uparrow & \uparrow & \uparrow \\ sp^3 & sp^3 & sp^3 & sp^3 \end{matrix} \rightarrow CH_4$

All bond angles 109.5°

Dr. A. Al-Saadi 69

Chapter 9 Section 4

sp , sp^2 and sp^3 Hybridizations

TABLE 9.4 Number of Electron Domains and Hybrid Orbitals on Central Atom

Number of Electron Domains on Central Atom	Hybrid Orbitals	Geometry
2	sp	Linear
3	sp^2	Trigonal planar
4	sp^3	Tetrahedral

Dr. A. Al-Saadi 70

Chapter 9 Section 4

sp^3d Hybridization

$P \begin{matrix} \uparrow & \uparrow \\ 3s^2 & 3p^3 & & & & & & & & & 3d \end{matrix} \xrightarrow{\text{promotion}} P^* \begin{matrix} \uparrow & \uparrow \\ 3s^1 & 3p^3 & & & & & & & & & 3d^1 \end{matrix}$

$P^* \begin{matrix} \uparrow & \uparrow \\ 3s & 3p & 3p & & & & & & & & 3d \end{matrix} \xrightarrow{\text{hybridization}} \begin{matrix} \uparrow & \uparrow \\ sp^3d & & & & & & & & & & 3d \end{matrix}$

sp^3d hybrid orbitals are used by atoms with expanded octet.

Bond angles are 120° and 90° and geometry is trigonal bipyramidal

There are five electron domains on the central atom

Dr. A. Al-Saadi 71

Chapter 9 Section 4

sp^3d^2 Hybridization

sp^3d^2 hybrid orbitals are also used by atoms with expanded octet.

There are six electron domains on the central atom

$S \begin{matrix} \uparrow & \uparrow \\ 3s^2 & 3p^4 & & & & & & & & & 3d \end{matrix} \xrightarrow{\text{promotion}} S^* \begin{matrix} \uparrow & \uparrow \\ 3s^1 & 3p^4 & & & & & & & & & 3d^2 \end{matrix}$

$S^* \begin{matrix} \uparrow & \uparrow \\ 3s & 3p & 3p & & & & & & & & 3d \end{matrix} \xrightarrow{\text{hybridization}} \begin{matrix} \uparrow & \uparrow \\ sp^3d^2 & & & & & & & & & & & 3d \end{matrix}$

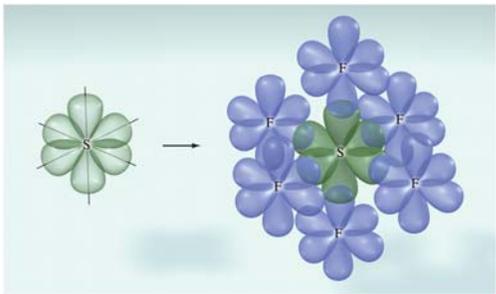

Mixing of one s orbital, three p orbitals, and two d orbitals to yield six sp^3d^2 orbitals

Dr. A. Al-Saadi 72

Chapter 9 Section 4

 sp^3d^2 Hybridization

- The sp^3d^2 hybrid orbitals on the S atom adopt 90° angles and a geometry that is octahedral.

Dr. A. Al-Saadi

73

Chapter 9 Section 4

 sp , sp^2 , sp^3 , sp^3d and sp^3d^2 Hybridizations

□ In order to predict the correct hybridization for a given atom :

- 1) Draw correct **Lewis structure**.
- 2) Determine the **number of electron domains** on the central atom.
- 3) Use the table to predict the appropriate hybridization and geometry

Number of Electron Domains on Central Atom	Hybrid Orbitals	Geometry
2	sp	Linear
3	sp^2	Trigonal planar
4	sp^3	Tetrahedral
5	sp^3d	Trigonal bipyramidal
6	sp^3d^2	Octahedral

Dr. A. Al-Saadi

74

Chapter 9 Section 4

Exercises

- Predict the hybridization of the central atom in the following molecules:
 - Ammonia (NH_3)
 - KrF_4
 - BrCl_3

Dr. A. Al-Saadi

75

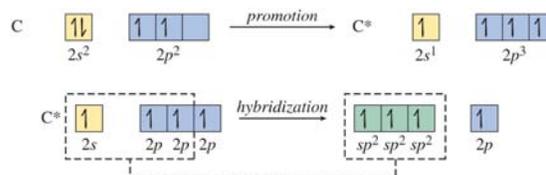

Chapter 9 Section 5

Hybridization in Molecules Containing Multiple Bonds
