

William Stallings Data and Computer Communications

Chapter 1 Introduction

A Communications Model

- ⌘ Source
 - ☑ generates data to be transmitted
- ⌘ Transmitter
 - ☑ Converts data into transmittable signals
- ⌘ Transmission System
 - ☑ Carries data
- ⌘ Receiver
 - ☑ Converts received signal into data
- ⌘ Destination
 - ☑ Takes incoming data

Simplified Communications Model - Diagram

(a) General block diagram

(b) Example

Key Communications Tasks

⌘ Transmission System Utilization

- ☑ Make efficient use of shared transmission facilities
- ☑ Multiplexing
- ☑ Congestion control

⌘ Interfacing

- ☑ A device must interface with the transmission system

⌘ Signal Generation

- ☑ Signals must be
 - ☑ Capable of being propagated through transmission system
 - ☑ Interpretable as data at the receiver

Key Communications Tasks

⌘ Synchronization

- ☒ Receiver must know
 - ☒ When a signal begins to arrive and when it ends
 - ☒ Duration of a signal

⌘ Exchange Management

- ☒ Both devices may transmit simultaneously or take turns
- ☒ Amount of data sent at one time
- ☒ Data format
- ☒ What to do if an error occurs

Key Communications Tasks

⌘ Error detection and correction

- ☒ Required when errors cannot be tolerated

⌘ Flow Control

- ☒ Assure that source does not overwhelm destination by sending data faster than can be processed

⌘ Recovery

- ☒ Required when an information exchange is interrupted due to a fault in the system
- ☒ Resume activity at point of interruption or
- ☒ Restore system state to condition prior to beginning of exchange

Key Communications Tasks

⌘ Addressing and routing

- ☑ A source system must indicate the identity of intended destination
- ☑ Transmission system maybe a network through which various paths (routes) must be chosen

⌘ Message formatting

- ☑ Both parties must agree on form of data to be exchanged

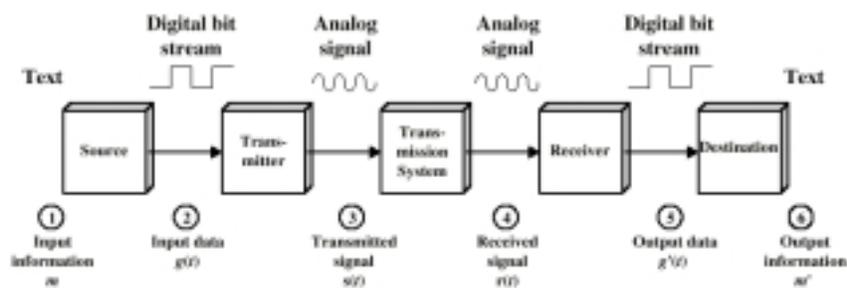

⌘ Security

- ☑ Sender assured only intended receiver receives data
- ☑ Receiver assured data not altered in transit and actually came from purported sender

⌘ Network Management

- ☑ Configure system, monitor its status, react to failures and overloads.

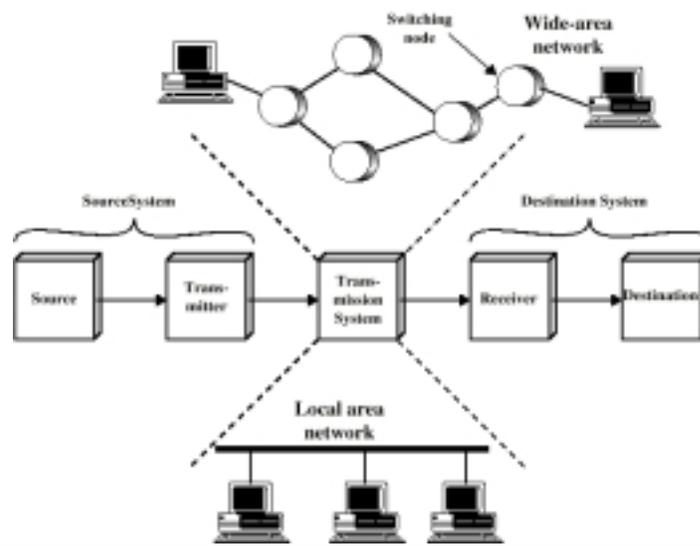

Simplified Data Communications Model

Networking

- ⌘ Point to point communication not usually practical
 - ☒ Devices are too far apart
 - ☒ Large set of devices would need impractical number of connections
- ⌘ Solution is a communications network
- ⌘ Communication networks classified into
 - ☒ Wide area networks (WANs)
 - ☒ Local area networks (LANs)

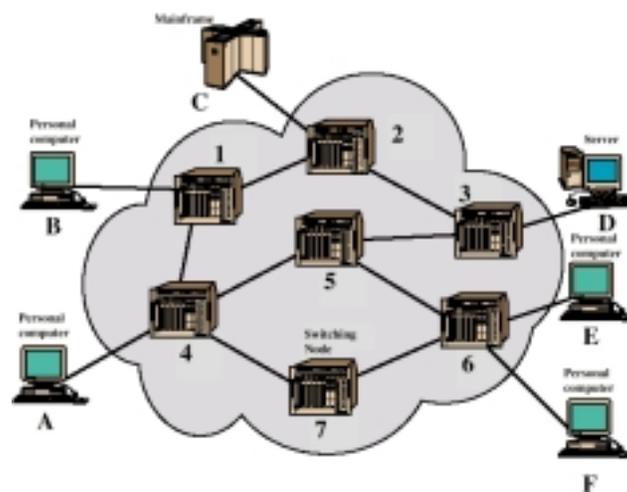

Simplified Network Model

Wide Area Networks

- ⌘ Large geographical area
- ⌘ Crossing public rights of way
- ⌘ Rely in part on common carrier circuits
- ⌘ Consists of a number of interconnected switching nodes
- ⌘ Alternative technologies
 - ☑ Circuit switching
 - ☑ Packet switching
 - ☑ Frame relay
 - ☑ Asynchronous Transfer Mode (ATM)

Simple Switched Network

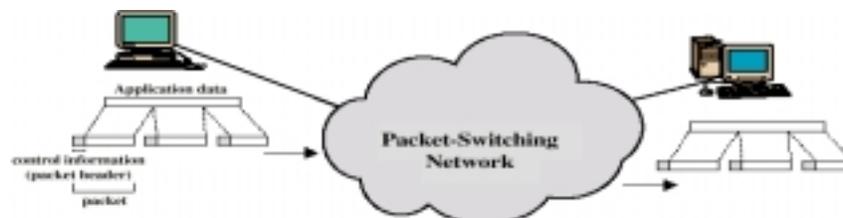

Circuit Switching

- ⌘ Dedicated communications path established for the duration of the conversation
 - ☒ e.g. telephone network
- ⌘ The path is a connected sequence of physical links between nodes
- ⌘ Inefficient
 - ☒ Channel capacity dedicated for duration of connection
 - ☒ If no data, capacity wasted
- ⌘ Set up (connection) takes time
- ⌘ Once connected, transfer is transparent
- ⌘ Developed for voice traffic (phone)

Packet Switching

- ⌘ Station breaks long message into packets sent one at a time to the network
- ⌘ Packets pass from node to node between source and destination
- ⌘ Data sent out of sequence
- ⌘ Used for computer to computer communications

Packet Switching

⌘ Advantages

- ☒ Line efficiency
 - ☒ Single node to node link can be shared by many packets over time
 - ☒ Packets queued and transmitted as fast as possible
- ☒ Data rate conversion
 - ☒ Each station connects to the local node at its own speed
 - ☒ Nodes buffer data if required to equalize rates
- ☒ Packets are accepted even when network is busy
 - ☒ Delivery may slow down

⌘ Priorities can be used

Frame Relay

- ⌘ Packet switching systems have large overheads to compensate for errors
- ⌘ Modern systems are more reliable
- ⌘ Errors can be caught in end system
- ⌘ Most overhead for error control is stripped out
- ⌘ Original packet switching networks designed with a data rate of 64 Kbps
- ⌘ Frame relay designed with a data rate of 2 Mbps

Asynchronous Transfer Mode

- ⌘ ATM is evolution of frame relay
- ⌘ Frame relay uses variable length packets called frames
- ⌘ ATM uses fixed length packets called cells
- ⌘ Little overhead for error control
- ⌘ Data rate from 10Mbps to Gbps
- ⌘ Constant data rate using packet switching technique

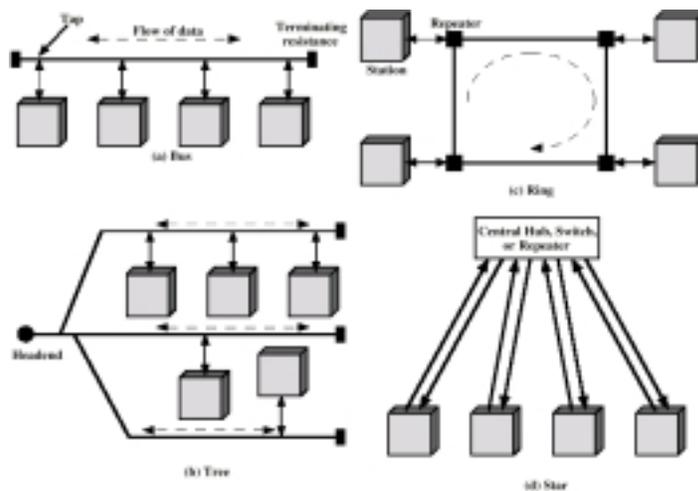

Integrated Services Digital Network

- ⌘ ISDN designed to replace public telecom system
- ⌘ Defined by standardization of user interfaces
- ⌘ Implemented as a set of digital switches and paths
- ⌘ Entirely digital domain
- ⌘ Supports voice and non-voice applications
- ⌘ Support for switched and non-switched applications
- ⌘ Reliance on 64 Kbps connections
 - ☒ Basic service: 192 Kbps
 - ☒ Primary service: 1.544 Mbps and 2.048 Mbps

Local Area Networks

- ⌘ Smaller scope
 - ☑ Building or small campus
- ⌘ Usually owned by same organization as attached devices
- ⌘ Data rates much higher
- ⌘ Usually broadcast systems
- ⌘ Now some switched systems and ATM are being introduced

LAN Topologies

Protocols & Protocol Architecture

- ⌘ In addition to data path, we need to account for other factors in communication network:
 - ☒ Source must identify the destination to the network
 - ☒ Source must make sure that destination is prepared to accept data
 - ☒ Security must be accounted for; data should go to the intended user on the receiver
 - ☒ Incompatible file formats may need to be translated
- ⌘ Computer Communication
 - ☒ Exchange of information between computers for cooperative action

Protocols

- ⌘ Communication must follow some mutually acceptable conventions , referred to as **protocol**
- ⌘ Set of rules governing the transfer of data between entities
- ⌘ Used for communications between entities in different systems
- ⌘ Communicating entities must speak the same language
- ⌘ **Entities**: anything capable of sending or receiving information
 - ☒ User applications, e-mail facilities, terminals
- ⌘ **Systems**: physically distinct object that contains one or more entities
 - ☒ Computer, terminal, remote sensor

Key Elements of a Protocol

⌘ Syntax

- ☑ Data format and size
- ☑ Signal levels

⌘ Semantics

- ☑ Control information
- ☑ Error handling
- ☑ Actions to take in response to reception of different messages

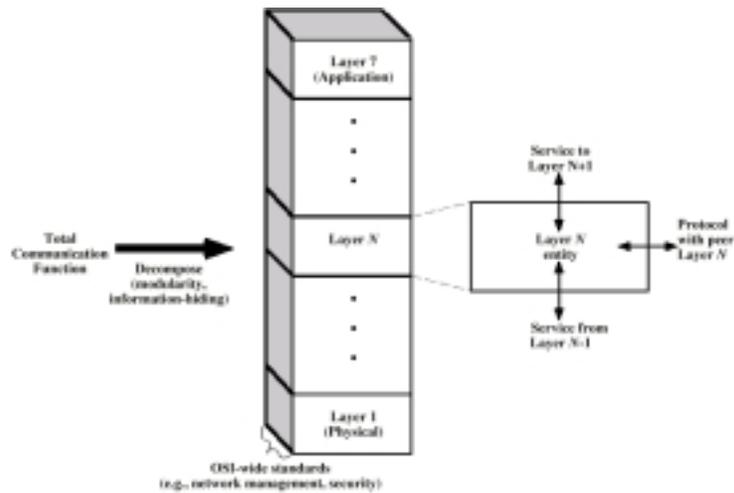

⌘ Timing

- ☑ Speed matching
- ☑ Sequencing
- ☑ When to discard a message, retransmit, give up

Protocol Architecture

- ⌘ Protocols can quickly become very complicated (and thus incorrect)
- ⌘ Implement functionality with several protocols
- ⌘ Layering is a popular way of structuring such a family of network protocols
- ⌘ Each layer represents a new level of abstraction with well defined function
- ⌘ Layer N defined in terms of layer N-1 only, providing total interface to layer N+1

Protocol Architecture

Protocol Architecture

- ⌘ Interfaces are primitive objects, operations, services provided by one layer to its higher layers
- ⌘ Task of communication broken up into modules
- ⌘ For example file transfer could use three modules
 - ☑ File transfer application
 - ☑ Communication service module
 - ☑ Network access module

Protocol Architecture

⌘ File transfer application

- ☒ Transmitting passwords, file commands, file records
- ☒ Perform format translation if necessary

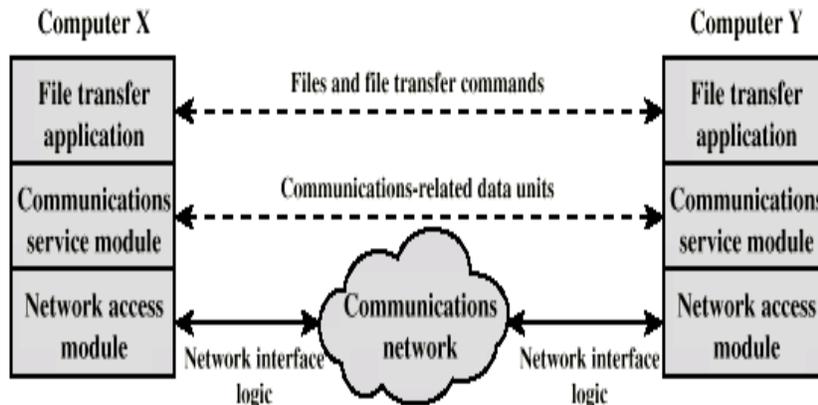

⌘ Communication service module

- ☒ Assure that the two computers are active and ready for data transfer
- ☒ Keep track of data being exchanged to assure delivery

⌘ Network access module

- ☒ Interface and interact with the network

Simplified File Transfer Architecture

A Three Layer Model

- ⌘ Communications involve three agents:
applications, computers, and networks
- ⌘ File transfer operation:
 - ☒ Application=>Computer=>Network=> Computer=>Application
- ⌘ Communication tasks organized into three layers
 - ☒ Network access layer
 - ☒ Transport layer
 - ☒ Application layer

Network Access Layer

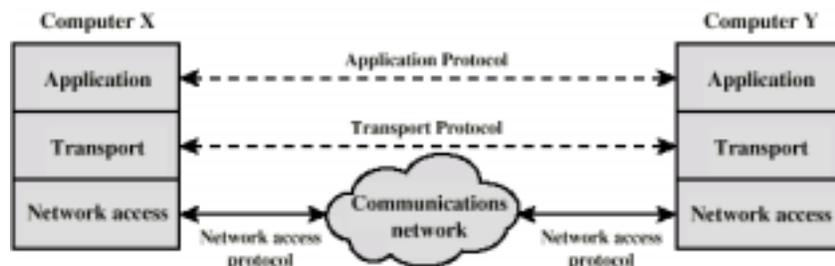

- ⌘ Exchange of data between the computer and the network
- ⌘ Sending computer provides address of destination
- ⌘ May invoke levels of service such as priority
- ⌘ Dependent on type of network used (LAN, packet switched, circuit switching, etc.)
- ⌘ Communication software above network access layer need not know type of network

Transport Layer

- ⌘ Data must be exchanged reliably and in same order as sent
- ⌘ Contains mechanisms for reliable data transportation
- ⌘ Independent of network being used
- ⌘ Independent of application
- ⌘ Provides services useful to variety of applications
- ⌘ Sharing of communication resources

Application Layer

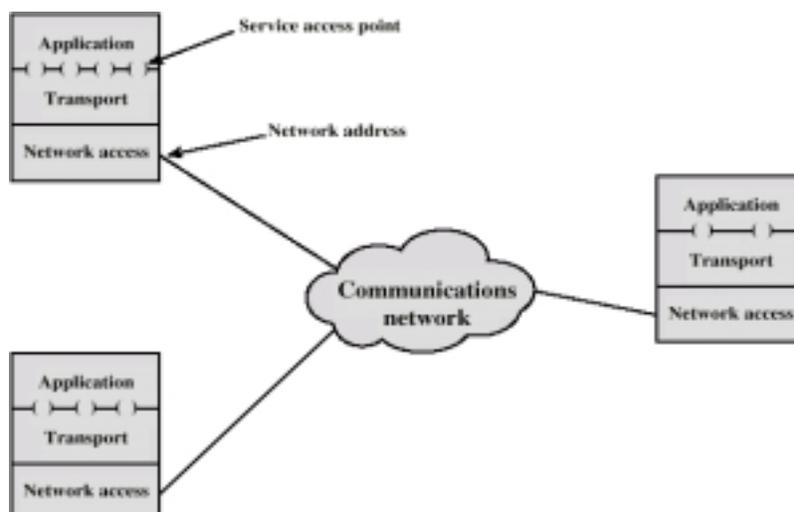

- ⌘ Contains logic needed to support various user applications
 - ☑ e.g. e-mail, file transfer
- ⌘ Separate module for each application

Addressing Requirements

- ⌘ Every entity in overall system must have a unique address
- ⌘ Two levels of addressing required
- ⌘ Each computer needs unique network address
- ⌘ Each application on a (multi-tasking) computer needs a unique address within the computer
 - ☑ The **service access point** or SAP

Protocol Architectures and Networks

Protocol Data Units (PDU)

- ⌘ At each layer, protocols are used to communicate
- ⌘ Control information is added to user data at each layer
- ⌘ Transport layer may fragment user data
- ⌘ Each fragment, called a transport **protocol data unit**, has a transport header added
 - ☒ Destination SAP
 - ☒ Sequence number
 - ☒ Error detection code
- ⌘ Network PDU adds network header
 - ☒ network address for destination computer
 - ☒ Facilities requests like priority level

Protocol Data Units (PDU)

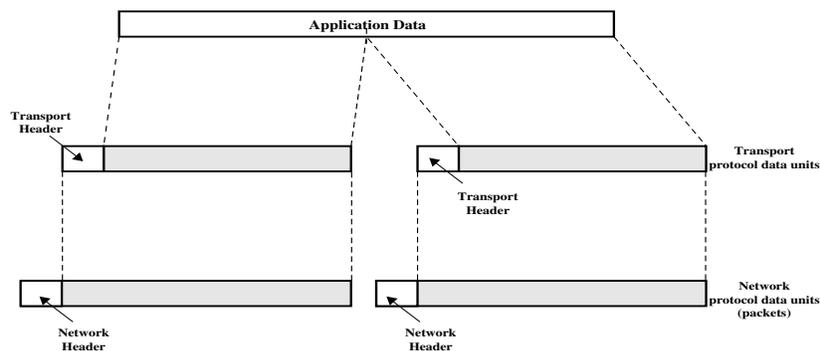

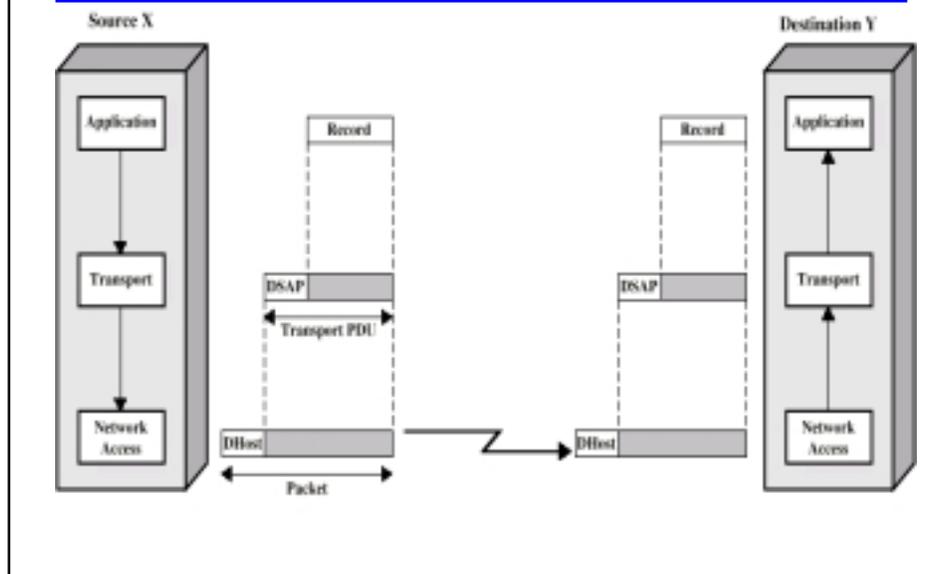

Figure 1.7 Protocol Data Units

Operation of a Protocol Architecture

Protocol Architectures

- ⌘ Two protocol architectures as the basis for development of interoperable communications standards
 - ☑ TCP/IP protocol suite
 - ☑ OSI reference model
- ⌘ TCP (Transmission Control Protocol)/IP (Internet Protocol) is the most widely used interoperable architecture
- ⌘ OSI (Open Systems Interconnection) model is the standard model for classifying communications functions

TCP/IP Protocol Architecture

- ⌘ Developed by the US Defense Advanced Research Project Agency (DARPA) for its packet switched network (ARPANET)
- ⌘ Used by the global Internet
- ⌘ No official model but a working one
 - ☒ Application layer
 - ☒ Host to host or transport layer
 - ☒ Internet layer
 - ☒ Network access layer
 - ☒ Physical layer

Physical Layer

- ⌘ Physical interface between data transmission device (e.g. computer) and transmission medium or network
- ⌘ Characteristics of transmission medium
- ⌘ Nature of signals
- ⌘ Data rates

Network Access Layer

- ⌘ Exchange of data between end system and network
- ⌘ Destination address provision
- ⌘ Invoking services like priority
- ⌘ Different standards are used for circuit switching, packet switching (X.25), LANs (Ethernet)
- ⌘ Mainly concerned with access and routing data between **two computers in same network**

Internet Layer (IP)

- ⌘ Systems may be attached to different networks
- ⌘ Routing functions across multiple networks
- ⌘ Implemented in end systems and routers
- ⌘ Routers connect two networks and relay data from one network to the other

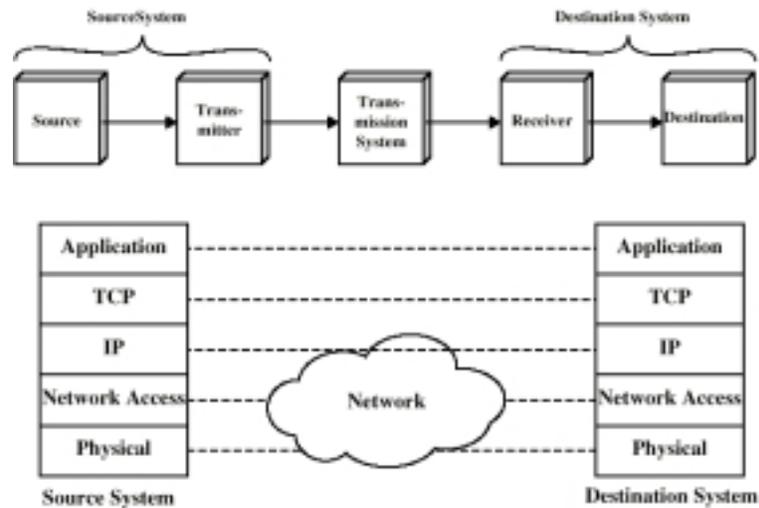

Transport Layer (TCP)

- ⌘ Reliable delivery of data
- ⌘ Ordering of delivery
- ⌘ Most common protocol is the transmission control protocol (TCP)

Application Layer

- ⌘ Contains logic to support various user applications
- ⌘ Separate module for each application
 - ☑ e.g. http, ftp, telnet

TCP/IP Protocol Architecture Model

OSI Model

- ⌘ Open Systems Interconnection
- ⌘ Developed by the International Organization for Standardization (ISO)
- ⌘ A model for computer communications architecture
- ⌘ Framework for developing protocol standards
- ⌘ Seven layers
- ⌘ TCP/IP is the de facto standard

OSI Layers

- ⌘ Application
- ⌘ Presentation
- ⌘ Session
- ⌘ Transport
- ⌘ Network
- ⌘ Data Link
- ⌘ Physical

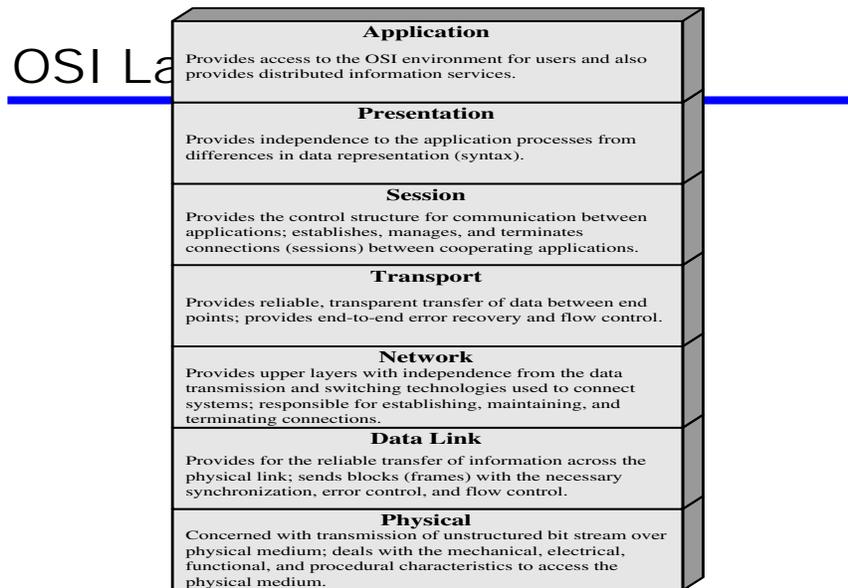

Figure 1.10 The OSI Layers

OSI Layers

⌘ Physical layer:

- ☒ Transmits unstructured bit stream over transmission medium
- ☒ Mechanical, electrical, functional, and procedural characteristics to access medium

⌘ Data link layer:

- ☒ Reliable transfer of information across physical layer
- ☒ Sends blocks/frames with synchronization, error control, and flow control

OSI Layers

⌘ Network layer:

- ☒ Separates data transmission and switching technologies from upper levels
- ☒ Establishes, maintains, and terminates connections

⌘ Transport layer:

- ☒ Reliable and transparent transfer of data between end points
- ☒ End-to-end error recovery and flow control

OSI Layers

⌘ Session layer:

- ☒ Control structure for communication between applications
- ☒ Establishes, maintains, and terminates sessions between cooperating applications

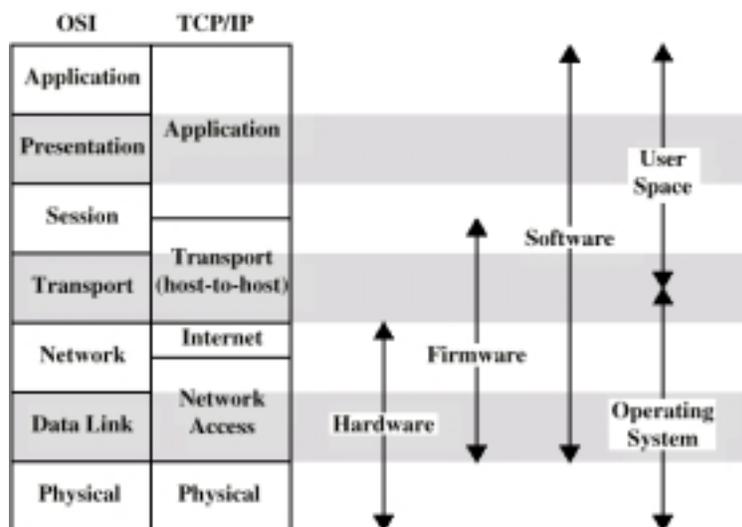

⌘ Presentation layer:

- ☒ Makes applications independent from differences in data presentation

⌘ Application layer:

- ☒ Access to the OSI environment
- ☒ Distributed information services

OSI vs. TCP/IP

Standards

- ⌘ Required to allow for interoperability between equipment
- ⌘ Govern physical, electrical, and procedural characteristics of communication equipment
- ⌘ Advantages
 - ☒ Ensures a large market for equipment and software
 - ☒ Allows products from different vendors to communicate
- ⌘ Disadvantages
 - ☒ Freeze technology
 - ☒ May be multiple standards for the same thing

Standards Organizations

- ⌘ Internet Society
- ⌘ ISO (International Organization for Standardization)
- ⌘ ITU-T (International Telecommunication Union)
 - ☒ formally CCITT (International Telegraph and Telephone Consultative Committee)
- ⌘ ATM forum
