1

Machine Representation of Numbers

- Computers store numbers in special digital electronic devices called REGISTERS
- REGISTERS consist of a fixed number of storage elements
- Each storage element can store one BIT of data (either 1 or 0)
- A register has a FINITE number of bits
 - Register size (n) is the number of bits in this register
 - N is typically a power of 2 (e.g. 8, 16, 32, 64, etc.)
 - A register of size n can represent 2^n distinct values
 - Numbers stored in a register can be either signed or unsigned

3/10/2003

Dr. Ashraf S. Hasan Mahmoud

2

N-bit Register

- N-storage elements

- Each storage element capable of holding ONE bit (either 1 or 0)
- n-bits can represent 2^n distinct values
 - For example if unsigned integer numbers are to be represented, we can represent all numbers from 0 to 2^n-1 (recall the number ranges for n-bits)
 - If we use it to represent signed numbers, still it can hold 2^n different numbers – we will learn about the ranges of these numbers in the coming slides

N-bit Register – cont'd

- Using a 4-bit register, $(13)_{10}$ or $(D)_H$ is represented as follows:

- Using an 8-bit register, $(13)_{10}$ or $(D)_H$ is represented as follows:

- Note that ZEROS are used to pad the binary representation of 13 in the 8-bit register
- We are still using UNSIGNED NUMBERS

Signed Number Representation

- To report a “signed” number, you need to specify its:
 - Magnitude (or absolute value), and
 - Sign (positive or negative)
- There are two major techniques to represent signed numbers
 1. Signed Magnitude Representation
 2. Complement Method

Signed Magnitude Representation

- N-bit register

Signed Magnitude Representation – Example 1:

- Show how +6, -6, +13, and -13 are represented using a 4-bit register
- Solution: Using a 4-bit register, the leftmost bit is reserved for the sign, which leaves 3 bits only to represent the magnitude
 - The largest magnitude that can be represented = $2^{(4-1)} - 1 = 7 < 13$
 - Hence, the numbers +13 and -13 can NOT be represented using the 4-bit register

3/10/2003

Dr. Ashraf S. Hasan Mahmoud

7

Signed Magnitude Representation – Example 1: cont'd

- Solution (cont'd):
However both -6 and +6 can be represented as follows:

3/10/2003

Dr. Ashraf S. Hasan Mahmoud

8

Signed Magnitude Representation – Example 2:

- Show how +6, -6, +13, and -13 are represented using an 8-bit register
- Solution: Using an 8-bit register, the leftmost bit is reserved for the sign, which leaves 7 bits only to represent the magnitude
 - The largest magnitude that can be represented = $2^{(8-1)} - 1 = 127$Hence, the numbers can be represented using the 8-bit register

3/10/2003

Dr. Ashraf S. Hasan Mahmoud

9

Signed Magnitude Representation – Example 2: cont'd

- Solution (cont'd):
Since 6 and 13 are equal to : 110 and 1101 respectively, the required representations are

Singed-Magnitude representation of +6 →

0	0	0	0	0	1	1	0
---	---	---	---	---	---	---	---

Singed-Magnitude representation of -6 →

1	0	0	0	0	1	1	0
---	---	---	---	---	---	---	---

Singed-Magnitude representation of +13 →

0	0	0	0	1	1	0	1
---	---	---	---	---	---	---	---

Singed-Magnitude representation of -13 →

1	0	0	0	1	1	0	1
---	---	---	---	---	---	---	---

3/10/2003

Dr. Ashraf S. Hasan Mahmoud

10

Things We Learned About Signed-Magnitude Representation

- For an n-bit register
 - Leftmost bit is reserved for the sign (0 for +ve and 1 for -ve)
 - Remaining n-1 bits represent the magnitude
 - $2^{(n-1)}$ different numbers: – minimum is zero and maximum is $2^{(n-1)}-1$
- Two representations for zero: +0 and -0
- Range of numbers: from $-\{2^{(n-1)}-1\}$ to $+\{2^{(n-1)}-1\}$ → symmetric range

Complement Representation

- +ve numbers (+N) are represented exactly the same way as in signed-magnitude representation
- -ve numbers (-N) are represented by the *complement* of N or N'

How is the complement of N or N' defined?

$$N' = M - N \quad \text{where } M \text{ is some constant}$$

Properties of the Complement Representation

- The complement of the complement of N is equal to N:

Proof: $(N')' = M - (M - N) = -(-N) = N$

Same as with -ve numbers definition!

- The complement method representation of signed numbers simplifies implementation of arithmetic operations like subtraction:

e.g.: $A - B$ can be replaced by $A + (-B)$ or $A + B'$ using the complement method

Therefore to perform subtraction using computers we complement and add the subtrahend

How to Choose M?

- Consider the following number:

$$X = X_{n-1} \dots X_2 X_1 X_0 \cdot X_{-1} X_{-2} \dots X_{-(m-1)} X_{-m}$$

(n integral digits – m fractional digits)

- Using the base-r number system, there can be two types of the complement representation

- Radix Complement (R's Complement)

→ $M = r^n$

- Diminished Radix Complement (R-1's Complement):

→ $M = r^n - r^m$

$= r^n - \text{ulp}$

Recall that $r^n = 1_n 0_{n-1} \dots 0_1 0_0$
 $= 1$ followed by n zeros

Recall that $r^m = 0 \dots 00.00 \dots 01$

$=$ unit in the least position

How to Choose M? – cont'd

- Note that:
 - $M = r^n - r^m$ is the LARGEST unsigned number that can be represented
 - From the definitions of M, R's complement of N is equal to R-1's complement of N plus ulp

Summary of Complement Method

- R's Complement:

Number System	R's Complement	Complement of X
Decimal	10's Complement	$X'_{10} = 10^n - X$
Binary	2's Complement	$X'_2 = 2^n - X$
Octal	8's Complement	$X'_8 = 8^n - X$
Hexadecimal	16's Complement	$X'_{16} = 16^n - X$

Summary of Complement Method – cont'd

- R-1's Complement:

Number System	R-1's Complement	Complement of X
Decimal	9's Complement	$X'_9 = (10^n - 10^{-m}) - X$ $= 99...99.99...99 - X$
Binary	1's Complement	$X'_1 = (2^n - 2^{-m}) - X$ $= 11...11.11...11 - X$
Octal	7's Complement	$X'_7 = (8^n - 8^{-m}) - X$ $= 77...77.77...77 - X$
Hexadecimal	15's Complement	$X'_{15} = (16^n - 16^{-m}) - X$ $= FF...FF.FF...FF - X$

3/10/2003

Dr. Ashraf S. Hasan Mahmoud

17

Example 1a:

- Find the 9's and 10's complement of 2357?

- Solution:

$$X = 2357 \rightarrow n = 4$$

$$\begin{aligned} X'_9 &= (10^4 - 1) - X \\ &= (10000 - 1) - 2357 \\ &= 9999 - 2357 \\ &= 7642 \end{aligned}$$

$$\begin{aligned} X'_{10} &= 10^4 - X \\ &= 10000 - 2357 \\ &= 7643 \end{aligned}$$

Or alternatively,

$$X'_{10} = X'_9 + \text{ulp} = 7642 + 1 = 7643$$

Note that: $X + X'_9 = 2357 + 7642 = 9999 = M$

While $X + X'_{10} = 2357 + 7643 = 10000 = M$

3/10/2003

Dr. Ashraf S. Hasan Mahmoud

18

Example 1b:

- Find the 9's and 10's complement of 2895.786?

- Solution:

$$X = 2895.786 \rightarrow n = 4, m = 3$$

$$\begin{aligned} X'_9 &= (10^4 - \text{ulp}) - X \\ &= (10000 - 0.001) - 2895.786 \\ &= 9999.999 - 2895.786 \\ &= 7104.213 \end{aligned}$$

$$\begin{aligned} X'_{10} &= 10^4 - X \\ &= 10000 - 2895.786 \\ &= 7104.214 \end{aligned}$$

Note that: $X + X'_9 = 2895.786 + 7104.213 = 9999.999 = M$
While $X + X'_{10} = 2895.786 + 7104.214 = 10000.000 = M$

Or alternatively,

$$X'_{10} = X'_9 + \text{ulp} = 7642 + 1 = 7104.214$$

Example 2a:

- Find the 1's and 2's complement of 110101010?

- Solution:

$$X = 110101010 \rightarrow n = 9$$

$$\begin{aligned} X'_1 &= (2^9 - \text{ulp}) - X \\ &= (100000000 - 1) - 110101010 \\ &= 111111111 - 110101010 \\ &= 001010101 \end{aligned}$$

$$\begin{aligned} X'_2 &= 2^9 - X \\ &= 100000000 - 110101010 \\ &= 001010110 \end{aligned}$$

Note that: $X + X'_1 = 110101010 + 001010101 = 111111111 = M$
While $X + X'_2 = 110101010 + 001010110 = 100000000 = M$

Or alternatively,

$$X'_2 = X'_1 + \text{ulp} = 001010101 + 1 = 001010110$$

Example 2b:

- Find the 1's and 2's complement of 1010.001?

- Solution:

$$X = 1010.001 \rightarrow n = 4, m = 3$$

$$\begin{aligned} X'_1 &= (2^4 - \text{ulp}) - X \\ &= (10000 - 0.001) - 1010.001 \\ &= 1111.111 - 1010.001 \\ &= 0101.110 \end{aligned}$$

$$\begin{aligned} X'_2 &= 2^4 - X \\ &= 10000 - 1010.001 \\ &= 0101.111 \end{aligned}$$

Note that: $X + X'_1 = 1010.001 + 0101.110 = 1111.111 = M$
While $X + X'_2 = 1010.001 + 0101.110 = 10000.000 = M$

Or alternatively,

$$X'_2 = X'_1 + \text{ulp} = 0101.110 + 0.001 = 0101.111$$

Notes On 1's and 2's Complements Computation:

- 1's complement can be obtained by bitwise complementing the bits of X

Examples (from previous slide)

$$X = 1010.001 \rightarrow X'_1 = 0101.110$$

- 2's complement of X can be obtained by:

- Adding ulp to its 1's complement, or

$$X = 1010.001 \rightarrow X'_1 = 0101.110 \xrightarrow{\text{ulp is added}} X'_2 = 0101.111$$

- Scanning X from right to left, copy all digits including first 1, complement all remaining digits

$$X = 1010.001 \rightarrow X'_2 = 0101.111$$

↑
↑
↑
↑

You complement subsequent bits
1st one you keep

Example 3a:

- Find the 7's and the 8's complement of the following octal number 6770?

- Solution:

$$X = 6770 \rightarrow n = 4$$

$$\begin{aligned} X'_7 &= (8^4 - \text{ulp}) - X \\ &= (10000 - 1) - 6770 \\ &= 7777 - 6770 \\ &= 1007 \end{aligned}$$

$$\begin{aligned} X'_8 &= 8^4 - X \\ &= 10000 - 6770 \\ &= 1010 \end{aligned}$$

Or alternatively,

$$X'_8 = X'_7 + \text{ulp} = 1007 + 1 = 1010$$

Example 3b:

- Find the 7's and the 8's complement of the following octal number 541.736?

- Solution:

$$X = 541.736 \rightarrow n = 3, m = 3$$

$$\begin{aligned} X'_7 &= (8^3 - \text{ulp}) - X \\ &= (10000 - 0.001) - 541.736 \\ &= 777.777 - 541.736 \\ &= 236.041 \end{aligned}$$

$$\begin{aligned} X'_8 &= 8^3 - X \\ &= 10000 - 541.736 \\ &= 236.042 \end{aligned}$$

Or alternatively,

$$X'_8 = X'_7 + \text{ulp} = 236.041 + 0.001 = 236.042$$

Example 4a:

- Find the 15's and the 16's complement of the following Hex number 3FA9?

- Solution:

$$X = 3FA9 \rightarrow n = 4$$

$$\begin{aligned} X'_{15} &= (16^4 - \text{ulp}) - X \\ &= (10000 - 1) - 3FA9 \\ &= FFFF - 3FA9 \\ &= C056 \end{aligned}$$

$$\begin{aligned} X'_{16} &= 16^4 - X \\ &= 10000 - 3FA9 \\ &= C057 \end{aligned}$$

Or alternatively,

$$X'_{16} = X'_{15} + \text{ulp} = C056 + 1 = C057$$

Example 4b:

- Find the 15's and the 16's complement of the following Hex number 9B1.C70?

- Solution:

$$X = 9B1.C70 \rightarrow n = 3, m = 3$$

$$\begin{aligned} X'_{15} &= (16^3 - \text{ulp}) - X \\ &= (1000 - 0.001) - 9B1.C70 \\ &= FFF.FFF - 9B1.C70 \\ &= 64E.38F \end{aligned}$$

$$\begin{aligned} X'_{16} &= 16^3 - X \\ &= 1000 - 9B1.C70 \\ &= 64E.390 \end{aligned}$$

Or alternatively,

$$X'_{16} = X'_{15} + \text{ulp} = 64E.38F + 0.001 = 64E.390$$

Complement Representation – Example 5:

- Show how +53 and -53 are represented in 8-bit registers using signed-magnitude, 1's complement and 2's complement?
- Solution:
Note that $53 = 32 + 16 + 4 + 1$,
Therefore using 8-bit signed-magnitude:
 - +53 → 00110101 -53 → 10110101
- To find the representation in complement method:

Complement Representation – Example 5: cont'd

- Solution: cont'd
To find the representation in complement method.
 $(53)_{10} = (00110101)_2$ when written in 8-bit binary
- 1's complement → 11001010 (inverting every bit)
- 2's complement → 11001011 (adding ulp to X'_1)

Complement Representation – Example 5: cont'd

- Solution: cont'd
Putting all the results together in a table

	+53	-53
Signed-Magnitude	00110101	10110101
1's Complement	00110101	11001010
2's Complement	00110101	11001011

Note:

- +53 representation is the same for all methods
- For +53, the leftmost bit is 0 (+ve number)
- For -53, the leftmost bit is 1 (-ve number)

Example 6:

- For the shown 4-bit representations, indicate the corresponding decimal value in the shown representation

Example 6: cont'd

- Signed-Magnitude and 1's complement representations with TWO representations for ZERO
- Range from signed-magnitude and 1's complement is from -7 to +7
- 2's complement representation is not symmetrical
- Range for 2's complement is from -8 to +7 – with one representation for ZERO

	Unsigned	Signed-Magnitude	1's Complement	2's Complement
0000	0	0	0	0
0001	1	1	1	1
0010	2	2	2	2
0011	3	3	3	3
0100	4	4	4	4
0101	5	5	5	5
0110	6	6	6	6
0111	7	7	7	7
1000	8	-0	-7	-8
1001	9	-1	-6	-7
1010	10	-2	-5	-6
1011	11	-3	-4	-5
1100	12	-4	-3	-4
1101	13	-5	-2	-3
1110	14	-6	-1	-2
1111	15	-7	-0	-1

3/10/2003

Dr. Ashraf S. Hasan Mahmoud

31

Summary

- The following table summarizes the properties and ranges for the studied signed number representations

	Signed-Magnitude	1's Complement	2's Complement
Symmetric	Y	Y	N
No of Zeros	2	2	1
Largest	$2^{(n-1)}-1$	$2^{(n-1)}-1$	$2^{(n-1)}-1$
Smallest	$-\{2^{(n-1)}-1\}$	$-\{2^{(n-1)}-1\}$	$-2^{(n-1)}$

3/10/2003

Dr. Ashraf S. Hasan Mahmoud

32

Exercise

- Find the binary representation in signed magnitude, 1's complement, and 2's complement for the following decimal numbers: +13, -13, +39, +1, -1, +73, and -73. For all numbers, show the required representation for 6-bit and 8-bit registers

10's Complement

- For $n = 1$ and 2

$X'_{10} (n=1)$	X'_{10} using +/- in decimal
0	0
1	1
2	2
3	3
4	4
5	-5
6	-4
7	-3
8	-2
9	-1

$X'_{10} (n=2)$	X'_{10} using +/- in decimal
