**Number
Systems –
Base r**

3/17/2003

Dr. Ashraf S. Hasan Mahmoud

2

Number Systems – Base r

- General number in base r is written as:

$$A_{n-1} A_{n-2} \dots A_2 A_1 A_0 \cdot A_{-1} A_{-2} \dots A_{-(m-1)} A_{-m}$$

Integer Part (n digits)
Fraction Part (m digits)

↑
Radix Point

- Note that All A_i (digits) are less than r:
 - i.e. Allowed digits are 0, 1, 2, ..., r - 1 ONLY
- A_{n-1} is the MOST SIGNIFICANT Digit (MSD) of the number
- A_{-m} is the LEAST SIGNIFICANT Digit (LSD) of the number

A_{n-1} is the MSD of the integer part
 A_0 is the LSD of the integer part
 A_{-1} is the MSD of the fraction part
 A_{-m} is the LSD of the fraction part

3/17/2003

Dr. Ashraf S. Hasan Mahmoud

Number Systems – Base r

- The (base r) number

$$A_{n-1} A_{n-2} \dots A_2 A_1 A_0 \cdot A_{-1} A_{-2} \dots A_{-(m-1)} A_{-m}$$

is equal to

$$A_{n-1} \times r^{n-1} + A_{n-2} \times r^{n-2} + \dots + A_2 \times r^2 + A_1 \times r^1 + A_0 \times r^0 + A_{-1} \times r^{-1} + A_{-2} \times r^{-2} + \dots + A_{-(m-1)} \times r^{-(m-1)} + A_{-m} \times r^{-m}$$

FORM or SHAPE OF NUMBER

VALUE OF NUMBER

3/17/2003

Dr. Ashraf S. Hasan Mahmoud

4

Example – Decimal or Base 10

- For decimal system (base 10), the number

$$(724.5)_{10}$$

is equal to

$$\begin{aligned} & 7 \times 10^2 + 2 \times 10^1 + 4 \times 10^0 + 5 \times 10^{-1} \\ &= 7 \times 100 + 2 \times 10 + 4 \times 1 + 5 \times 0.1 \\ &= 700 + 20 + 4 + 0.5 \\ &= 724.5 \end{aligned}$$

It is all powers of 10:

...
 $10^3 = 1000,$
 $10^2 = 100,$
 $10^1 = 10,$
 $10^0 = 1,$
 $10^{-1} = 0.1,$
 $10^{-2} = 0.01,$
...

3/17/2003

Dr. Ashraf S. Hasan Mahmoud

5

Example – Base 5

- Base 5 $\rightarrow r = 5$
- Allowed digits are: 0, 1, 2, 3, and 4 ONLY
- The number

$$(312.4)_5$$

is equal to

$$\begin{aligned} & 3 \times 5^2 + 1 \times 5^1 + 2 \times 5^0 + 4 \times 5^{-1} \\ &= 3 \times 25 + 1 \times 5 + 2 \times 1 + 4 \times 0.2 \\ &= 75 + 5 + 2 + 0.8 \\ &= (82.8)_{10} \end{aligned}$$

$$\text{Therefore } (312.4)_5 = (82.8)_{10}$$

It is all powers of 5:

...
 $5^3 = 125,$
 $5^2 = 25,$
 $5^1 = 5,$
 $5^0 = 1$
 $5^{-1} = 0.2$
 $5^{-2} = 0.04,$
...

3/17/2003

Dr. Ashraf S. Hasan Mahmoud

6

A Third Example –Base 2

- Base 2 $\rightarrow r = 2$
 - This is referred to as the **BINARY SYSTEM**
- Allowed digits are: 0 and 1 ONLY
- The number

$$(110101.11)_2$$

is equal to

$$\begin{aligned} & 1X2^5 + 1X2^4 + 0X2^3 + 1X2^2 + 0X2^1 + 1X2^0 \\ & + 1X2^{-1} + 1X2^{-2} \\ & = 1 \times 32 + 1 \times 16 + 1 \times 4 + 1 \times 2 + 1 \times 0.5 \\ & + 1 \times 0.25 \\ & = 32 + 16 + 4 + 1 + 0.5 + 0.25 \\ & = (53.75)_{10} \end{aligned}$$

$$\text{Therefore } (110101.11)_2 = (53.75)_{10}$$

It is all powers of 5:

...
 $2^4 = 16$
 $2^3 = 8$,
 $2^2 = 4$,
 $2^1 = 2$,
 $2^0 = 1$
 $2^{-1} = 0.5$
 $2^{-2} = 0.25$,
...

3/17/2003

Dr. Ashraf S. Hasan Mahmoud

Decimal to Binary Conversion of Integer Numbers

- Conversion from base 2 to base 10 (for real numbers) – See previous slide
- To convert a decimal *integer* to binary \rightarrow decompose into powers of 2
 - Example: $(37)_{10} = (?)_2$
 - 37 has ONE 32 \rightarrow remainder is 5
 - 5 has ZERO 16 \rightarrow remainder is 5
 - 5 has ZERO 8 \rightarrow remainder is 5
 - 5 has ONE 4 \rightarrow remainder is 1
 - 1 has ZERO 2 \rightarrow remainder is 1
 - 1 has ONE 1 \rightarrow remainder is 0

$$\text{Therefore } (37)_{10} = (100101)_2$$

3/17/2003

Dr. Ashraf S. Hasan Mahmoud

8

Decimal to Binary Conversion of Integer Numbers– cont'd

- Or we can use the following (see table):
- You stop when the division result is ZERO
- Note the order of the resulting digits
- Therefore $(37)_{10} = (100101)_2$
- To check:
 $1 \times 2^5 + 1 \times 2 + 1 = 32 + 4 + 1 = 37$

No	No/2	Remainder	
37	18	1	← LSD
18	9	0	
9	4	1	
4	2	0	
2	1	0	
1	0	1	← MSD

In general: to convert a decimal integer to its equivalent in base r we use the above procedure but dividing by r

A Very Useful Table

- To represent decimal numbers from 0 till 15 (16 numbers) we need FOUR binary digits $B_3B_2B_1B_0$
- In general to represent N numbers, we need $\lceil \log_2 N \rceil$ bits
- Note how
 - B_0 flipped or COMPLEMENTED at every increment
 - B_1 flipped or COMPLEMENTED every 2 steps
 - B_2 flipped or COMPLEMENTED every 4 steps
 - B_3 flipped or COMPLEMENTED every 8 steps

Decimal	Binary	Decimal	Binary
0	0000	8	1000
1	0001	9	1001
2	0010	10	1010
3	0011	11	1011
4	0100	12	1100
5	0101	13	1101
6	0110	14	1110
7	0111	15	1111

A Very Useful Table – cont'd

- Note that zeros to the left of the number do not add to its value
- When we need DIGITS beyond 9, we will use the alphabets as shown in Table

Decimal	Binary	Decimal	Binary
0	0000	8	1000
1	0001	9	1001
2	0010	10 →A	1010
3	0011	11 →B	1011
4	0100	12 →C	1100
5	0101	13 →D	1101
6	0110	14 →E	1110
7	0111	15 →F	1111

- Example: base 16 system has 16 digits; these are: 0, 1, 2, 3, ..., 8, 9, A, B, C, D, E, F
- This is referred to as HEXADECIMAL or HEX number system

3/17/2003

Dr. Ashraf S. Hasan Mahmoud

11

Decimal to Binary Conversion of Fractions

- Example: $(0.234375)_{10} = (?)_2$
- Solution: We use the following procedure
- Note:**
 - The binary digits are the integer part of the multiplication process
 - The process stops when the number is 0
- There are situations where the process DOES NOT end – See next slide
- Therefore $(0.234375)_{10} = (0.001111)_2$
- To check: $(0.001111)_2 = 1 \times 2^{-2} + 1 \times 2^{-3} + 1 \times 2^{-4} + 1 \times 2^{-5} + 1 \times 2^{-5}$

No	NoX2	Integer Part
0.234375	0.46875	0 ← MSD
0.46875	0.9375	0
0.9375	1.875	1
0.875	1.75	1
0.75	1.5	1
0.5	1.0	1 ← LSD
0		

In general: to convert a decimal fraction to its equivalent in base r we use the above procedure but multiplying by r

3/17/2003

Dr. Ashraf S. Hasan Mahmoud

12

Decimal to Binary Conversion of Fractions – cont'd

- Example: $(0.513)_{10} = (?)_2$
- Solution: As in previous slide

Therefore $(0.513)_{10} = (0.100000110 \dots)_2$

If we chose to round to 1 significant figure $\rightarrow (0.1)_2$

Or to 7 significant figures $\rightarrow (0.1000001)_2$

Etc.

No	NoX2	Integer Part
0.513	1.026	1
0.026	0.052	0
0.052	0.104	0
0.104	0.208	0
0.208	0.416	0
0.416	0.832	0
0.832	1.664	1
0.664	1.328	1
0.328	0.656	0
...		

Octal Number System

- Base $r = 8$
- Allowed digits are $= 0, 1, 2, \dots, 6, 7$
- Example: the number $(127.4)_8$ has the decimal value

$$1 \times 8^2 + 2 \times 8^1 + 7 \times 8^0 + 4 \times 8^{-1}$$

$$= 1 \times 64 + 2 \times 8 + 7 + 0.5$$

$$= (87.5)_{10}$$

It is all powers of 8:

...
 $8^4 = 4096$
 $8^3 = 512,$
 $8^2 = 64,$
 $8^1 = 8,$
 $8^0 = 1$
 $8^{-1} = 0.125$
 $8^{-2} = 0.015625,$
 ...

Conversion between Octal and Binary

- **Example:** $(127)_8 = (?)_2$
- **Solution:** we can find the decimal equivalent (see previous slide) and then convert from decimal to binary

$$(127)_8 = (87)_{10} \rightarrow (?)_2$$

From long division

$$(127)_8 = (87)_{10} = (1010111)_2$$

To check:

$$\begin{aligned} & 1X2^6 + 1X2^4 + 1X2^2 + 1X2^1 + 1X2^0 \\ & = 64 + 16 + 4 + 2 + 1 \\ & = 87 \end{aligned}$$

No	No/2	Remainder
87	43	1
43	21	1
21	10	1
10	5	0
5	2	1
2	1	0
1	0	1

Conversion between Octal and Binary- cont'd

- **NOTE:** $(127)_8 = (1010111)_2$
- Lets group the binary digits in groups of 3 starting from the LSD

$$(1010111)_2 \rightarrow (001 \quad 010 \quad 111)_2$$

1

2

7

- That is the decimal equivalent of the first group $111 \rightarrow 7$
of the second group $010 \rightarrow 2$
of the third group $001 \rightarrow 1$

- Hence, to convert from Octal to Binary one can perform direct translation of the Octal digits into binary digits:
ONE Octal digit \leftrightarrow THREE Binary digits

Conversion between Octal and Binary – cont'd

- To convert from Binary to Octal, Binary digits are grouped into groups of three digits and then translated to Octal digits

- Example: $(1011101.10)_2 = (?)_8$

- Solution:

$$\begin{aligned} (1011101.10)_2 &= (001\ 011\ 101\ .\ 100)_2 \\ &= (1\ 3\ 5\ .\ 4)_8 \\ &= (135.4)_8 \end{aligned}$$

Note:

We can add zeros to the left of the number or to the right of the number after the radix point to form the groups

Conversion From Decimal to Octal

- Problem:** What is the octal equivalent of $(32.57)_{10}$?

- Solution:**

- We can convert $(32.57)_{10}$ to binary and then to Octal or

- We can do:

$$\begin{aligned} 32_{10} &\rightarrow 32/8 = 4 \text{ and remainder is } 0 \rightarrow 0 \\ &\quad 4/8 = 0 \text{ and remainder is } 4 \rightarrow 4 \end{aligned}$$

$$\text{hence, } 32_{10} = 40_8$$

$$(0.57)_{10} \rightarrow 0.57 \times 8 = 4.56 \rightarrow 4$$

$$0.56 \times 8 = 4.48 \rightarrow 4$$

$$0.48 \times 8 = 3.84 \rightarrow 3$$

$$0.84 \times 8 = 6.72 \rightarrow 6$$

...

$$\text{hence, } (0.57)_{10} = (0.4436)_8$$

$$\text{Therefore, } (32.57)_{10} = (40.4436)_8$$

What is $(0.4436)_8$ rounded for
-Two fraction digits?
-One fraction digit?

Hexadecimal Number Systems

- Base $r = 16$
- Allowed digits: 0, 1, 2, ..., 8, 9, A, B, C, D, E, F
- The values for the alphabetic digits are as show in Table

Hex	Value
A	10
B	11
C	12
D	13
E	14
F	15

- **Example 1:**

$$\begin{aligned}(B65F)_{16} &= BX16^3 + 6X16^2 + 5X16^1 + FX16^0 \\ &= 11X4096 + 6X256 + 5X16 + 15 \\ &= (46687)_{10}\end{aligned}$$

- **Example 2:**

$$\begin{aligned}(1B.3C)_{16} &= 1X16^1 + BX16^0 + 3X16^{-1} + CX16^{-2} \\ &= 16 + 11 + 3X0.0625 + 12X0.00390625 \\ &= (27.234375)_{10}\end{aligned}$$

Conversion Between Hex and Binary

- **Example:** $(1B.3C)_{16} = (?)_2$
- **Solution:** we can find the decimal equivalent (see previous slide) and then convert from decimal to binary

$$(1B)_{16} = (27)_{10} \rightarrow (?)_2$$

From long division

$$(1B)_{16} = (27)_{10} = (11011)_2$$

$$(0.3C)_{16} = (0.234375)_{10} = (0.001111)_2$$

$$\rightarrow \text{Therefore } (1B.3C)_{16} = (11011.001111)_2$$

Verify This Result

Conversion Between Hex and Binary – cont'd

- **Note:**

$(1B.3C)_{16} = (11011.001111)_2$ from previous example

Lets group the binary bits in groups of 4 starting from the radix point, adding zeros to the left of the number or to the right as needed

→ (0001 1011 . 0011 1100)

↑ ↑ ↑ ↑ ↑ ↑ ↑ ↑
1 **B** . **3** **C**

- Hence, to convert from Hex to Binary one can perform direct translation of the Hex digits into binary digits: ONE Hex digit \leftrightarrow FOUR Binary digits

Conversion between Hex and Binary – cont'd

- To convert from Binary to Hex, Binary digits are grouped into groups of four digits and then translated to Hex digits

- Example: $(1011101.10)_2 = (?)_{16}$

- Solution:

$$\begin{aligned}(1011101.10)_2 &= (0101\ 1101\ .\ 1000)_2 \\ &= (5\ D\ .\ 8)_{16} \\ &= (5D.8)_{16}\end{aligned}$$

Note:

We can add zeros to the left of the number or to the right of the number after the radix point to form the groups

Sample Exam Problem

- **Problem:** What is the radix r if
$$((33)_r + (24)_r) \times (10)_r = (1120)_r$$
- **Solution:**
$$(33)_r = 3r + 3,$$
$$(24)_r = 2r + 4,$$
$$(10)_r = r,$$
$$(1120)_r = r^3 + r^2 + 2r$$
therefore:
$$[(3r+3)+(2r+4)] \times r$$
$$= r^3 + r^2 + 2r \rightarrow r^3 - 4r^2 - 5r = 0, \text{ or}$$
$$r(r - 5)(r + 1) = 0$$
This means, the radix r is equal to 5

Number Ranges - Decimal

- Consider a decimal integer number of n digits:
$$A_{n-1}A_{n-2}\dots A_1A_0 \quad \text{where } A_i \in \{0,1,2, \dots, 9\}$$

Smallest integer is $0_{n-1}0_{n-2}\dots 0_10_0 = 0$

Largest integer is $9_{n-1}9_{n-2}\dots 9_19_0 = 10^n - 1$

Example: for n equal to 3 \rightarrow 3 digits integer decimals;
the maximum integer is 999 or $10^3 - 1$

Number Ranges – Decimal – cont'd

- Consider a decimal fraction of m digits:

$$0.A_{-1}A_{-2}\dots A_{-(m-1)}A_{-m} \quad \text{where } A_i \in \{0,1,2, \dots, 9\}$$

Smallest non-zeros fraction is $0.0_{-1}0_{-2}\dots 0_{-(m-1)}1_{-m} = 10^{-m}$

Largest fraction is $0.9_{-1}9_{-2}\dots 9_{-(m-1)}9_{-m} = 1 - 10^{-m}$

Example: for m equal to 3 → 3 digits decimal fraction;

The minimum fraction is 10^{-3} or 0.001

The maximum number is $1 - 10^{-3}$ or 0.999

Number Ranges – Base-r Numbers

- Consider a base-r integer of n digits:

$$A_{n-1}A_{n-2}\dots A_1A_0 \quad \text{where } A_i \in \{0,1,2, \dots, r-1\}$$

Smallest integer is $0_{n-1}0_{n-2}\dots 0_10_0 = 0$

Largest integer is $(r-1)_{n-1}(r-1)_{n-2}\dots (r-1)_1(r-1)_0 = r^n - 1$

Example: for $r = 5$, n equal to 3 → 3 digits base-5 integer;

The maximum integer is $(444)_5$ or $(5^3 - 1)_{10}$

To check:

the decimal equivalent of $(444)_5$ is $4X5^2 + 4X5^1 + 4 = (124)_{10}$ or simply $5^3 - 1 = (124)_{10}$

Number Ranges - Base-r Numbers

- Consider a base-r fraction of m digits:

$$0.A_{-1}A_{-2}\dots A_{-(m-1)}A_{-m} \text{ where } A_i \in \{0,1,2, \dots, r-1\}$$

Smallest non-zero fraction is

$$(0.0_{-1}0_{-2}\dots 0_{-(m-1)}1_{-m})_r = (r^{-m})_{10}$$

Largest fraction is

$$(0.(r-1)_{-1}(r-1)_{-2}\dots (r-1)_{-(m-1)}(r-1)_{-m})_r = (1 - r^{-m})_{10}$$

Example: for r = 5 and m equal to 3 → 3 digits base-5 fraction;

The maximum number is $(0.444)_5$ or $1 - 5^{-3} = 0.992$

Number Ranges - Base-r Numbers – cont'd

		Decimal (r=10)	Binary (r = 2)	Octal (r = 8)	Hex (r = 16)
Integer	Min	$0_{n-1}0_{n-2}\dots 0_10_0$ = 0	$0_{n-1}0_{n-2}\dots 0_10_0$ = 0	$0_{n-1}0_{n-2}\dots 0_10_0$ = 0	$0_{n-1}0_{n-2}\dots 0_10_0$ = 0
	Max	$9_{n-1}9_{n-2}\dots 9_19_0$ = $10^n - 1$	$(1_{n-1}1_{n-2}\dots 1_11_0)_2$ = $(2^n - 1)_{10}$	$(8_{n-1}8_{n-2}\dots 8_18_0)_8$ = $(8^n - 1)_{10}$	$(F_{n-1}F_{n-2}\dots F_1F_0)_{16}$ = $(16^n - 1)_{10}$

	Max	$0.9_{-1}9_{-2}\dots 9_{-(m-1)}9_{-m}$ = $1 - 10^{-m}$	$(0.1_{-1}1_{-2}\dots 1_{-(m-1)}1_{-m})_2$ = $(1 - 2^{-m})_{10}$	$(0.7_{-1}7_{-2}\dots 7_{-(m-1)}7_{-m})_8$ = $(1 - 8^{-m})_{10}$	$(0.F_{-1}F_{-2}\dots F_{-(m-1)}F_{-m})_{16}$ = $(1 - 16^{-m})_{10}$

Exercises

- What is 8^4 equal to in octal?
 $(8^4)_{10} = (10000)_8$
- What is 2^5 equal to in binary?
 $(2^5) = (100000)_2$
- What is $16^4 - 1$ equal to in Hex?
- What is $2^3 - 2^{-2}$ equal to in Binary?
- What is $16^5 - 16^4$ equal to in Hex?
- What is $3^4 - 3^{-2}$ equal to in base-3?
- What is $2^4 - 2^{-2}$ equal to in base-3?

Addition and Subtraction of (Unsigned) Numbers

Binary Addition of UNSIGNED Numbers

- Consider the following example:
Find the summation of $(1100)_2$ and $(10001)_2$

Solution:

	101100	← Carry
Augend	01100	
Addend	+10001	
-----	-----	
sum	101001	

- Note that
 - $0+0 = 0$, $0+1 = 1+0 = 1$, and $1+1 = 0$ and the carry is 1
 - If the maximum no of digits for the augend or the addend is n , then the summation has either n or $n+1$ digits
 - This procedure works even for non-integer binary numbers

Binary Subtraction of UNSIGNED Numbers

- Consider the following example:
Subtract $(10010)_2$ from $(10110)_2$

Solution:

Minuend	10110
Subtrahend	-10010
-----	-----
Difference	00100

- Note that
 - $(10110)_2$ is greater than $(10010)_2$ → The result is POSITIVE
 - $0-0 = 0$, $1-0 = 1$, and $1-1 = 0$
 - The difference size is always less or equal to the size of the minuend or the subtrahend
 - This procedure works even for non-integer binary numbers

Binary Subtraction – cont'd

- Consider the following example:
Subtract $(10011)_2$ from $(10110)_2$

Solution:

	00110	← Borrow
Minuen	10110	
Subtrahend	-10011	

Difference	00011	

- Note that
 - $(10110)_2$ is greater than $(10011)_2$ → result is positive
 - $0-1=1$, and the borrow from next significant digit is 1
 - This procedure works even for non-integer binary numbers

Binary Subtraction – cont'd

- Consider the following example:
Subtract $(11110)_2$ from $(10011)_2$

Solution:

		00110	← Borrow
Minuen	10011	11110	
Subtrahend	-11110	-10011	
	-----	-----	
Difference	-01011	01011	

2 1

- Note that
 - $(10011)_2$ is smaller than $(11110)_2$ → result is negative
 - This procedure works even for non-integer binary numbers

Binary Multiplication of UNSIGNED Numbers

- Consider the following example:
Multiply $(1011)_2$ by $(101)_2$

Solution:

Multiplicand	1011
Multiplier	X 101
-----	-----
	1011
	0000
	1011

Product	110111

Sums and Products in Base r (Unsigned Numbers)

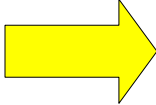

- For sums and Products in base-r ($r > 2$) systems
 - Memorize tables for sums and products
 - Convert to Dec \rightarrow perform operation \rightarrow convert back to base-r
- Example:** Find the summation of $(59F)_{16}$ and $(E46)_{16}$?

- This procedure is used for any base-r

Sums and Products in Base-r – cont'd

- **Example:** Find the multiplication of $(762)_8$ and $(45)_8$?
- **Solution:**

$ \begin{array}{r} 3310 \leftarrow \text{Carry (for 4)} \\ 4310 \leftarrow \text{Carry (for 5)} \\ 762 \\ \times 45 \\ \hline 4672 \\ 3710 \\ \hline 43772 \end{array} $		<table style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="text-align: left;">Octal</th> <th style="text-align: left;">Decimal</th> <th style="text-align: left;">Octal</th> </tr> </thead> <tbody> <tr> <td>5×2</td> <td>$= 10 \rightarrow 8 + 2$</td> <td>$= 12$</td> </tr> <tr> <td>$5 \times 6 + 1$</td> <td>$= 31 \rightarrow 24 + 7$</td> <td>$= 37$</td> </tr> <tr> <td>$5 \times 7 + 3$</td> <td>$= 38 \rightarrow 32 + 6$</td> <td>$= 46$</td> </tr> <tr> <td>4×2</td> <td>$= 8 \rightarrow 8 + 0$</td> <td>$= 10$</td> </tr> <tr> <td>$4 \times 6 + 1$</td> <td>$= 25 \rightarrow 24 + 1$</td> <td>$= 31$</td> </tr> <tr> <td>$4 \times 7 + 3$</td> <td>$= 24 + 7$</td> <td>$= 37$</td> </tr> </tbody> </table>	Octal	Decimal	Octal	5×2	$= 10 \rightarrow 8 + 2$	$= 12$	$5 \times 6 + 1$	$= 31 \rightarrow 24 + 7$	$= 37$	$5 \times 7 + 3$	$= 38 \rightarrow 32 + 6$	$= 46$	4×2	$= 8 \rightarrow 8 + 0$	$= 10$	$4 \times 6 + 1$	$= 25 \rightarrow 24 + 1$	$= 31$	$4 \times 7 + 3$	$= 24 + 7$	$= 37$
Octal	Decimal	Octal																					
5×2	$= 10 \rightarrow 8 + 2$	$= 12$																					
$5 \times 6 + 1$	$= 31 \rightarrow 24 + 7$	$= 37$																					
$5 \times 7 + 3$	$= 38 \rightarrow 32 + 6$	$= 46$																					
4×2	$= 8 \rightarrow 8 + 0$	$= 10$																					
$4 \times 6 + 1$	$= 25 \rightarrow 24 + 1$	$= 31$																					
$4 \times 7 + 3$	$= 24 + 7$	$= 37$																					

Therefore, product = $(43772)_8$

Decimal Codes

3/17/2003

Dr. Ashraf S. Hasan Mahmoud

38

Decimal Codes

- There are 2^n **DISTINCT** n-bit binary codes (group of n bits)
 - n bits can count 2^n numbers
- For us, humans, it is more natural to deal with decimal digits rather than binary digits
- 10 different digits → we can use 4 bits to represent any digit
 - 3 bits count 8 numbers
 - 4 bits count 16 numbers → to represent 10 digits we need 4 bits at least

Binary Coded Decimal (BCD)

- Let the decimal digits be coded as show in table

Decimal Digit	Binary Code	Decimal Digit	Binary Code
0	0000	5	0101
1	0001	6	0110
2	0010	7	0111
3	0011	8	1000
4	0100	9	1001

- Then we can write numbers as

$$(396)_{10} = (0011\ 1001\ 0110)_{\text{BCD}}$$

Since 3 → 0011, 9 = 1001, 6 = 0110

Although we are using the equal sign – but they are not equal in the mathematical sense; this is **JUST a code**

Note that $(396)_{10} = (110001100)_2 \neq (0011\ 1001\ 0110)_{\text{BCD}}$

BCD Addition – Example 1

- Consider:

000 ← Carry
 241
 +105

 346

Addition in the
 Decimal Domain

```

    0010 → Carry
    BCD for 1 = 0001
    BCD for 5 = 0101
    -----
    0110 → BCD for 6

    0000 → Carry
    BCD for 4 = 0100
    BCD for 0 = 0000
    -----
    0100 → BCD for 4

    0000 → Carry
    BCD for 2 = 0010
    BCD for 1 = 0001
    -----
    0011 → BCD for 3
  
```

Addition in the
 Decimal Domain

Hence, we can add BCD codes to obtain the correct decimal result. Is true always?

3/17/2003

Dr. Ashraf S. Hasan Mahmoud

41

BCD Addition – Example 2

- Consider:

110 ← Carry
 448
 +489

 937

Addition in the
 Decimal Domain

```

    0010 → Carry
    BCD for 8 = 1000
    BCD for 9 = 1001
    -----
    1 0001 → > 9 → Need a correction step
    +0110 (add 6)
    -----
    1 0111 → (BCD for 7)

    0001 → Carry
    BCD for 4 = 0100
    BCD for 8 = 1000
    -----
    1101 → > 9 → Need a correction step
    +0110 (add 6)
    -----
    1 0011 → (BCD for 3)

    0001 → Carry
    BCD for 4 = 0100
    BCD for 4 = 0100
    -----
    1001 → BCD for 9
  
```

Addition in the
 Decimal Domain

3/17/2003

Dr. Ashraf S. Hasan Mahmoud

42

BCD Addition – Summary

- BCD codes: decimal digits are assigned 4 bit codes
- We can perform additions using the BCD digits
 - If the result of adding two BCD digits is greater than 9, a correction step is required in order produce the correct BCD digit
 - To correct: add 6
 - If a carry is produced → move it to next BCD digits addition

Alphanumeric Codes

- We have
 - 10 decimal digits
 - 26 X 2 (English) letters: capital and small case
 - Some special characters { ; , . : + - etc }
- If we assign each character of these a binary code, then computers can exchange alphanumeric information (letters, numbers, etc) by exchanging binary digits
- One binary code is the American Standard Code for Information Interchange (ASCII)

ASCII

- A 7-bits code → 128 distinct codes
 - 96 printable characters (26 upper case letter, 26 lower case letters, 10 decimal digits, 34 non-alphanumeric characters)
 - 32 non-printable character
 - Formatting effectors (CR, BS, ...)
 - Info separators (RS, FS, ...)
 - Communication control (STX, ETX, ...)
- Computers typically use words sizes that are multiples of 2
 - Usually 8 bits are used for the ASCII code with the 8th (left most bit) bit set to zero, OR
 - The ASCII code is extended → Extended ASCII (platform dependant)
- A good reference about ASCII and Extended ASCII is found at <http://www.cplusplus.com/doc/papers/ascii.html>

ASCII – cont'd

- A 7-bits code → 128 distinct codes
- The American Standard Code for Information Interchange (ASCII) uses seven binary digits to represent 128 characters as shown in the table.

- Homework: Chapter 1, pages 24-26: 2, 3, 8, 12, 14, 16, 19, 24, 26
Due date: Monday March 17, 2003 (in class)

Signed Numbers Representations

3/17/2003

Dr. Ashraf S. Hasan Mahmoud

49

Machine Representation of Numbers

- Computers store numbers in special digital electronic devices called REGISTERS
- REGISTERS consist of a fixed number of storage elements
- Each storage element can store one BIT of data (either 1 or 0)
- A register has a FINITE number of bits
 - Register size (n) is the number of bits in this register
 - N is typically a power of 2 (e.g. 8, 16, 32, 64, etc.)
 - A register of size n can represent 2^n distinct values
 - Numbers stored in a register can be either signed or unsigned

3/17/2003

Dr. Ashraf S. Hasan Mahmoud

50

N-bit Register

- N-storage elements

- Each storage element capable of holding ONE bit (either 1 or 0)
- n-bits can represent 2^n distinct values
 - For example if unsigned integer numbers are to be represented, we can represent all numbers from 0 to 2^n-1 (recall the number ranges for n-bits)
 - If we use it to represent signed numbers, still it can hold 2^n different numbers – we will learn about the ranges of these numbers in the coming slides

N-bit Register – cont'd

- Using a 4-bit register, $(13)_{10}$ or $(D)_H$ is represented as follows:

- Using an 8-bit register, $(13)_{10}$ or $(D)_H$ is represented as follows:

- Note that ZEROS are used to pad the binary representation of 13 in the 8-bit register
- We are still using UNSIGNED NUMBERS

Signed Number Representation

- To report a “signed” number, you need to specify its:
 - Magnitude (or absolute value), and
 - Sign (positive or negative)
- There are two major techniques to represent signed numbers
 1. Signed Magnitude Representation
 2. Complement Method

Signed Magnitude Representation

- N-bit register

Signed Magnitude Representation – Example 1:

- Show how +6, -6, +13, and -13 are represented using a 4-bit register
- Solution: Using a 4-bit register, the leftmost bit is reserved for the sign, which leaves 3 bits only to represent the magnitude
 - The largest magnitude that can be represented = $2^{(4-1)} - 1 = 7 < 13$
 - Hence, the numbers +13 and -13 can NOT be represented using the 4-bit register

3/17/2003

Dr. Ashraf S. Hasan Mahmoud

55

Signed Magnitude Representation – Example 1: cont'd

- Solution (cont'd):
However both -6 and +6 can be represented as follows:

3/17/2003

Dr. Ashraf S. Hasan Mahmoud

56

Signed Magnitude Representation – Example 2:

- Show how +6, -6, +13, and -13 are represented using an 8-bit register
- Solution: Using an 8-bit register, the leftmost bit is reserved for the sign, which leaves 7 bits only to represent the magnitude
 - The largest magnitude that can be represented = $2^{(8-1)} - 1 = 127$Hence, the numbers can be represented using the 8-bit register

3/17/2003

Dr. Ashraf S. Hasan Mahmoud

57

Signed Magnitude Representation – Example 2: cont'd

- Solution (cont'd):
Since 6 and 13 are equal to : 110 and 1101 respectively, the required representations are

Singed-Magnitude representation of +6 →

0	0	0	0	0	1	1	0
---	---	---	---	---	---	---	---

Singed-Magnitude representation of -6 →

1	0	0	0	0	1	1	0
---	---	---	---	---	---	---	---

Singed-Magnitude representation of +13 →

0	0	0	0	1	1	0	1
---	---	---	---	---	---	---	---

Singed-Magnitude representation of -13 →

1	0	0	0	1	1	0	1
---	---	---	---	---	---	---	---

3/17/2003

Dr. Ashraf S. Hasan Mahmoud

58

Things We Learned About Signed-Magnitude Representation

- For an n-bit register
 - Leftmost bit is reserved for the sign (0 for +ve and 1 for -ve)
 - Remaining n-1 bits represent the magnitude
 - $2^{(n-1)}$ different numbers: – minimum is zero and maximum is $2^{(n-1)}-1$
- Two representations for zero: +0 and -0
- Range of numbers: from $-\{2^{(n-1)}-1\}$ to $+\{2^{(n-1)}-1\}$ → symmetric range

Complement Representation

- +ve numbers (+N) are represented exactly the same way as in signed-magnitude representation
- -ve numbers (-N) are represented by the *complement* of N or N'

How is the complement of N or N' defined?

$$N' = M - N \quad \text{where } M \text{ is some constant}$$

Properties of the Complement Representation

- The complement of the complement of N is equal to N:

Proof: $(N')' = M - (M - N) = -(-N) = N$

Same as with -ve numbers definition!

- The complement method representation of signed numbers simplifies implementation of arithmetic operations like subtraction:

e.g.: $A - B$ can be replaced by $A + (-B)$ or $A + B'$ using the complement method

Therefore to perform subtraction using computers we complement and add the subtrahend

How to Choose M?

- Consider the following number:

$$X = X_{n-1} \dots X_2 X_1 X_0 \cdot X_{-1} X_{-2} \dots X_{-(m-1)} X_{-m}$$

(n integral digits – m fractional digits)

- Using the base-r number system, there can be two types of the complement representation

- Radix Complement (R's Complement)

→ $M = r^n$

- Diminished Radix Complement (R-1's Complement):

→ $M = r^n - r^m$

$= r^n - \text{ulp}$

Recall that $r^n = 1_n 0_{n-1} \dots 0_1 0_0$
 $= 1$ followed by n zeros

Recall that $r^m = 0 \dots 00.00 \dots 01$

$=$ unit in the least position

How to Choose M? – cont'd

- Note that:
 - $M = r^n - r^m$ is the LARGEST unsigned number that can be represented
 - From the definitions of M, R's complement of N is equal to R-1's complement of N plus ulp

Summary of Complement Method

- R's Complement:

Number System	R's Complement	Complement of X
Decimal	10's Complement	$X'_{10} = 10^n - X$
Binary	2's Complement	$X'_2 = 2^n - X$
Octal	8's Complement	$X'_8 = 8^n - X$
Hexadecimal	16's Complement	$X'_{16} = 16^n - X$

Summary of Complement Method – cont'd

- R-1's Complement:

Number System	R-1's Complement	Complement of X
Decimal	9's Complement	$X'_9 = (10^n - 10^{-m}) - X$ $= 99...99.99...99 - X$
Binary	1's Complement	$X'_1 = (2^n - 2^{-m}) - X$ $= 11...11.11...11 - X$
Octal	7's Complement	$X'_7 = (8^n - 8^{-m}) - X$ $= 77...77.77...77 - X$
Hexadecimal	15's Complement	$X'_{15} = (16^n - 16^{-m}) - X$ $= FF...FF.FF...FF - X$

3/17/2003

Dr. Ashraf S. Hasan Mahmoud

65

Example 1a:

- Find the 9's and 10's complement of 2357?
- Solution:

$$X = 2357 \rightarrow n = 4$$

$$\begin{aligned} X'_9 &= (10^4 - 1) - X \\ &= (10000 - 1) - 2357 \\ &= 9999 - 2357 \\ &= 7642 \end{aligned}$$

$$\begin{aligned} X'_{10} &= 10^4 - X \\ &= 10000 - 2357 \\ &= 7643 \end{aligned}$$

Or alternatively,

$$X'_{10} = X'_9 + \text{ulp} = 7642 + 1 = 7643$$

Note that: $X + X'_9 = 2357 + 7642 = 9999 = M$

While $X + X'_{10} = 2357 + 7643 = 10000 = M$

3/17/2003

Dr. Ashraf S. Hasan Mahmoud

66

Example 1b:

- Find the 9's and 10's complement of 2895.786?

- Solution:

$$X = 2895.786 \rightarrow n = 4, m = 3$$

$$\begin{aligned} X'_9 &= (10^4 - \text{ulp}) - X \\ &= (10000 - 0.001) - 2895.786 \\ &= 9999.999 - 2895.786 \\ &= 7104.213 \end{aligned}$$

$$\begin{aligned} X'_{10} &= 10^4 - X \\ &= 10000 - 2895.786 \\ &= 7104.214 \end{aligned}$$

Note that: $X + X'_9 = 2895.786 + 7104.213 = 9999.999 = M$
While $X + X'_{10} = 2895.786 + 7104.214 = 10000.000 = M$

Or alternatively,

$$X'_{10} = X'_9 + \text{ulp} = 7642 + 1 = 7104.214$$

Example 2a:

- Find the 1's and 2's complement of 110101010?

- Solution:

$$X = 110101010 \rightarrow n = 9$$

$$\begin{aligned} X'_1 &= (2^9 - \text{ulp}) - X \\ &= (100000000 - 1) - 110101010 \\ &= 111111111 - 110101010 \\ &= 001010101 \end{aligned}$$

$$\begin{aligned} X'_2 &= 2^9 - X \\ &= 100000000 - 110101010 \\ &= 001010110 \end{aligned}$$

Note that: $X + X'_1 = 110101010 + 001010101 = 111111111 = M$
While $X + X'_2 = 110101010 + 001010110 = 100000000 = M$

Or alternatively,

$$X'_2 = X'_1 + \text{ulp} = 001010101 + 1 = 001010110$$

Example 2b:

- Find the 1's and 2's complement of 1010.001?

- Solution:

$$X = 1010.001 \rightarrow n = 4, m = 3$$

$$\begin{aligned} X'_1 &= (2^4 - \text{ulp}) - X \\ &= (10000 - 0.001) - 1010.001 \\ &= 1111.111 - 1010.001 \\ &= 0101.110 \end{aligned}$$

$$\begin{aligned} X'_2 &= 2^4 - X \\ &= 10000 - 1010.001 \\ &= 0101.111 \end{aligned}$$

Note that: $X + X'_1 = 1010.001 + 0101.110 = 1111.111 = M$
While $X + X'_2 = 1010.001 + 0101.110 = 10000.000 = M$

Or alternatively,

$$X'_2 = X'_1 + \text{ulp} = 0101.110 + 0.001 = 0101.111$$

Notes On 1's and 2's Complements Computation:

- 1's complement can be obtained by bitwise complementing the bits of X

Examples (from previous slide)

$$X = 1010.001 \rightarrow X'_1 = 0101.110$$

- 2's complement of X can be obtained by:

- Adding ulp to its 1's complement, or

$$X = 1010.001 \rightarrow X'_1 = 0101.110 \xrightarrow{\text{ulp is added}} X'_2 = 0101.111$$

- Scanning X from right to left, copy all digits including first 1, complement all remaining digits

$$X = 1010.001 \rightarrow X'_2 = 0101.111$$

↑
↑
↑
↑

You complement subsequent bits
1st one you keep

Example 3a:

- Find the 7's and the 8's complement of the following octal number 6770?

- Solution:

$$X = 6770 \rightarrow n = 4$$

$$\begin{aligned} X'_7 &= (8^4 - \text{ulp}) - X \\ &= (10000 - 1) - 6770 \\ &= 7777 - 6770 \\ &= 1007 \end{aligned}$$

$$\begin{aligned} X'_8 &= 8^4 - X \\ &= 10000 - 6770 \\ &= 1010 \end{aligned}$$

Or alternatively,

$$X'_8 = X'_7 + \text{ulp} = 1007 + 1 = 1010$$

Example 3b:

- Find the 7's and the 8's complement of the following octal number 541.736?

- Solution:

$$X = 541.736 \rightarrow n = 3, m = 3$$

$$\begin{aligned} X'_7 &= (8^3 - \text{ulp}) - X \\ &= (10000 - 0.001) - 541.736 \\ &= 777.777 - 541.736 \\ &= 236.041 \end{aligned}$$

$$\begin{aligned} X'_8 &= 8^3 - X \\ &= 10000 - 541.736 \\ &= 236.042 \end{aligned}$$

Or alternatively,

$$X'_8 = X'_7 + \text{ulp} = 236.041 + 0.001 = 236.042$$

Example 4a:

- Find the 15's and the 16's complement of the following Hex number 3FA9?

- Solution:

$$X = 3FA9 \rightarrow n = 4$$

$$\begin{aligned} X'_{15} &= (16^4 - \text{ulp}) - X \\ &= (10000 - 1) - 3FA9 \\ &= FFFF - 3FA9 \\ &= C056 \end{aligned}$$

$$\begin{aligned} X'_{16} &= 16^4 - X \\ &= 10000 - 3FA9 \\ &= C057 \end{aligned}$$

Or alternatively,

$$X'_{16} = X'_{15} + \text{ulp} = C056 + 1 = C057$$

Example 4b:

- Find the 15's and the 16's complement of the following Hex number 9B1.C70?

- Solution:

$$X = 9B1.C70 \rightarrow n = 3, m = 3$$

$$\begin{aligned} X'_{15} &= (16^3 - \text{ulp}) - X \\ &= (1000 - 0.001) - 9B1.C70 \\ &= FFF.FFF - 9B1.C70 \\ &= 64E.38F \end{aligned}$$

$$\begin{aligned} X'_{16} &= 16^3 - X \\ &= 1000 - 9B1.C70 \\ &= 64E.390 \end{aligned}$$

Or alternatively,

$$X'_{16} = X'_{15} + \text{ulp} = 64E.38F + 0.001 = 64E.390$$

Complement Representation – Example 5:

- Show how +53 and -53 are represented in 8-bit registers using signed-magnitude, 1's complement and 2's complement?
- Solution:
Note that $53 = 32 + 16 + 4 + 1$,
Therefore using 8-bit signed-magnitude:
 - +53 → 00110101 -53 → 10110101
- To find the representation in complement method:

Complement Representation – Example 5: cont'd

- Solution: cont'd
To find the representation in complement method.
 $(53)_{10} = (00110101)_2$ when written in 8-bit binary
- 1's complement → 11001010 (inverting every bit)
- 2's complement → 11001011 (adding ulp to X'_1)

Complement Representation – Example 5: cont'd

- Solution: cont'd
Putting all the results together in a table

	+53	-53
Signed-Magnitude	00110101	10110101
1's Complement	00110101	11001010
2's Complement	00110101	11001011

Note:

- +53 representation is the same for all methods
- For +53, the leftmost bit is 0 (+ve number)
- For -53, the leftmost bit is 1 (-ve number)

Example 6:

- For the shown 4-bit representations, indicate the corresponding decimal value in the shown representation

Example 6: cont'd

- Signed-Magnitude and 1's complement representations with TWO representations for ZERO
- Range from signed-magnitude and 1's complement is from -7 to +7
- 2's complement representation is not symmetrical
- Range for 2's complement is from -8 to +7 – with one representation for ZERO

	Unsigned	Signed-Magnitude	1's Complement	2's Complement
0000	0	0	0	0
0001	1	1	1	1
0010	2	2	2	2
0011	3	3	3	3
0100	4	4	4	4
0101	5	5	5	5
0110	6	6	6	6
0111	7	7	7	7
1000	8	-0	-7	-8
1001	9	-1	-6	-7
1010	10	-2	-5	-6
1011	11	-3	-4	-5
1100	12	-4	-3	-4
1101	13	-5	-2	-3
1110	14	-6	-1	-2
1111	15	-7	-0	-1

Summary

- The following table summarizes the properties and ranges for the studied signed number representations

	Signed-Magnitude	1's Complement	2's Complement
Symmetric	Y	Y	N
No of Zeros	2	2	1
Largest	$2^{(n-1)}-1$	$2^{(n-1)}-1$	$2^{(n-1)}-1$
Smallest	$-\{2^{(n-1)}-1\}$	$-\{2^{(n-1)}-1\}$	$-2^{(n-1)}$

Exercise

- Find the binary representation in signed magnitude, 1's complement, and 2's complement for the following decimal numbers: +13, -13, +39, +1, -1, +73, and -73. For all numbers, show the required representation for 6-bit and 8-bit registers

10's Complement

- For $n = 1$ and 2

$X'_{10} (n=1)$	X'_{10} using +/- in decimal
0	0
1	1
2	2
3	3
4	4
5	-5
6	-4
7	-3
8	-2
9	-1

$X'_{10} (n=2)$	X'_{10} using +/- in decimal
00	0
01	1
02	2
..	..
09	9
10	10
11	11
12	12
...	..
49	49
50	-50
51	-49
52	-48
...	...
98	-2
99	-1

8's Complement

- For $n = 1$ and 2

$X'_8 (n=1)$	X'_8 using +/- in decimal
0	0
1	1
2	2
3	3
4	-4
5	-3
6	-2
7	-1

$X'_8 (n=2)$	X'_8 using +/- in decimal
00	0
01	1
02	2
..	..
07	7
10	8
11	9
12	10
...	..
36	30
37	31
40	-32
41	-31
...	...
70	-8
71	-7
...	...
76	-2
77	-1

Operations On Binary Numbers

Operation On Binary Numbers

- Assuming we are dealing with n-bit binary numbers
 - UNSIGNED, or
 - SIGNED (2's complement)
- A subtraction can always be made into an addition operation $A - B = A + (-B)$ or $A + (B')$
 - Compute the 2's complement of the subtrahend and added to the minuend

Operations on Binary Numbers

- The GENERAL OPERATION looks like:

$$\begin{array}{rcccccccc}
 C_n & C_{n-1} & C_{n-2} & \dots & C_2 & C_1 & C_0 & \leftarrow \text{Carry generated} \\
 & A_{n-1} & A_{n-2} & \dots & A_2 & A_1 & A_0 & \rightarrow \text{Number A (signed or otherwise)} \\
 + & B_{n-1} & B_{n-2} & \dots & B_2 & B_1 & B_0 & \rightarrow \text{Number B (signed or otherwise)} \\
 \hline
 C_n & S_{n-1} & S_{n-2} & \dots & S_2 & S_1 & S_0 &
 \end{array}$$

- Note that although we start with n-bit numbers, we can end up with a result consisting of n+1 bits
 - Remember we are using n-bit registers!!
 - What to do with this extra bit (C_n)?

Addition of Unsigned Numbers - Review

- For n-bit words, the n-bit UNSIGNED binary numbers range from $(0_{n-1}0_{n-2}\dots0_10_0)_2$ to $(1_{n-1}1_{n-2}\dots1_11_0)_2$
i.e. they range from 0 to 2^n-1

- When adding A to B as in:

$$\begin{array}{rcccccccc}
 C_n & C_{n-1} & C_{n-2} & \dots & C_2 & C_1 & C_0 & \leftarrow \text{Carry generated} \\
 & A_{n-1} & A_{n-2} & \dots & A_2 & A_1 & A_0 & \rightarrow \text{Number A (unsigned)} \\
 + & B_{n-1} & B_{n-2} & \dots & B_2 & B_1 & B_0 & \rightarrow \text{Number B (unsigned)} \\
 \hline
 C_n & S_{n-1} & S_{n-2} & \dots & S_2 & S_1 & S_0 &
 \end{array}$$

- If C_n is equal to ZERO, then the result **DOES** fit into n-bit word ($S_{n-1} S_{n-2} \dots S_2 S_1 S_0$)
- If C_n is equal to ONE, then the result **DOES NOT** fit into n-bit word \rightarrow An "OVERFLOW" indicator!

Subtraction of Unsigned Numbers

- **How to perform $A - B$ (both defined as n -bit unsigned)?**
- **Procedure:**
 1. **Add the the 2's complement of B to A ; this forms $A + (2^n - B)$**
 2. **If $(A \geq B)$, the sum produces end carry signal (C_n); discard this carry**
 3. **If $A < B$, the sum does not produce end carry signal (C_n); result is equal to $2^n - (B-A)$, the 2's complement of $B-A$ – Perform correction:**
 - Take 2's complement of sum
 - Place –ve sign in front of result
 - Final result is $-(A-B)$

Subtraction of Unsigned Numbers - NOTES

- **Although we are dealing with unsigned numbers, we use the 2's complement to convert the subtraction into addition**
- **Since this is for UNSIGNED numbers, we have to use the –ve sign when the result of the operation is negative**

Subtraction of Unsigned Numbers – Example

- Example: $X = 1010100$ or $(84)_{10}$, $Y = 1000011$ or $(67)_{10}$ – Find $X-Y$ and $Y-X$

$n = 7$

- Solution:

A) $X - Y$: $X = 1010100$

2's complement of $Y = 0111101$

Sum = 10010001

Discard C_n (last bit) = 0010001 or $(17)_{10} \leftarrow X - Y$

B) $Y - X$: $Y = 1000011$

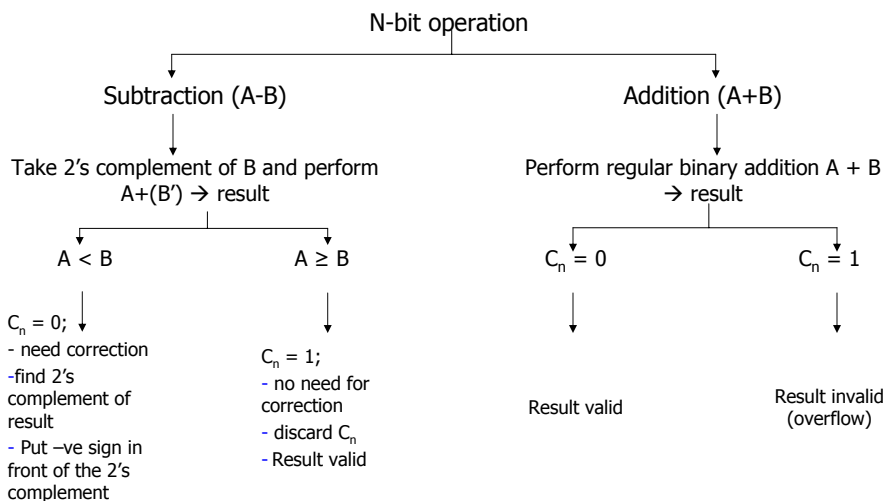

2's complement of $X = 0101100$

Sum = 1101111

C_n (last bit) is zero \rightarrow need to perform correction

$Y - X = -(2\text{'s complement of } 1101111) = -001001$

n-bit Unsigned Number Operations - Summary

2's Complement Review

- For n-bit words, the 2's complement **SIGNED** binary numbers range from $-(2^{n-1})$ to $+(2^{n-1}-1)$
e.g. for 4-bit words, range = - 8 to +7
- Note that **MSB** is always **1** for -ve numbers, and **0** for +ve numbers

Addition/Subtraction of n-bit Signed Numbers by Example (1)

- Consider

01 1000	111 0000	
+6 00 0110	-6 11 1010	
+ 13 00 1101	+13 00 1101	

+19 01 0011	+7 00 0111	$C_n = 1 \rightarrow \text{discarded}$

00 1100	110 0100	
+6 00 0110	-6 11 1010	
- 13 11 0011	- 13 11 0011	

- 7 11 1001	-19 101101	$C_n = 1 \rightarrow \text{discarded}$

n = 6 →
range $-2^{6-1} = -32$ to
 $(2^{6-1}-1) = 31$
Hence:
-All used numbers
are valid (within the
range)
-All results are also
valid (within the
range)

- Any carry out of sign bit position is **DISCARDED**
- -ve results are automatically in 2's complement form (no need for an explicit -ve sign)!

Are there cases when the results do not fit the n-bit register?

Addition/Subtraction of n-bit Signed Numbers by Example (2)

• Consider

$ \begin{array}{r} C_n \quad C_{n-1} \\ 10\ 0000 \\ 16\ 01\ 0000 \\ + 23\ 01\ 0111 \\ \hline \del{+39\ 10\ 0111} \end{array} $	$ \begin{array}{r} C_n \quad C_{n-1} \\ 110\ 0000 \leftarrow \text{carry} \\ -16\ 11\ 0000 \\ + 23\ 01\ 0111 \\ \hline +7\ 1\ 00\ 0111 \leftarrow \text{Result is valid} \\ \leftarrow \text{Discard } C_n \end{array} $
$ \begin{array}{r} C_n \quad C_{n-1} \\ 00\ 0000 \\ +16\ 01\ 0000 \\ - 23\ 10\ 1001 \\ \hline - 7\ 11\ 1001 \leftarrow \text{Result is valid} \end{array} $	$ \begin{array}{r} C_n \quad C_{n-1} \\ 100\ 0000 \leftarrow \text{carry} \\ -16\ 11\ 0000 \\ - 23\ 10\ 1001 \\ \hline \del{-39\ 101\ 1001} \end{array} $

n = 6 →
 range $-2^{6-1} = -32$ to
 $(2^{6-1}-1) = 31$
Hence:
 -All used numbers
 are valid (within the
 range)
 -All results are also
 valid (within the
 range)

~~X~~ though we started with valid
 6-bit signed numbers the results is
 in valid for a 6-bit signed
 representation

Addition/Subtraction of n-bit Signed Numbers by Example (2) – cont'd

• NOTE:

- The result is invalid (not within range) only if C_{n-1} and C_n are different! → An OVERFLOW has occurred
- The result is valid (within range) if C_{n-1} and C_n are the same
 - If $C_n = 1$; it needs to be discarded
- If result is valid and -ve, it will be in the correct 2's complement form

Addition/Subtraction of n-bit Signed Numbers - Summary

- Summary
