

# CSCI 447 – Fall 2002

## Assignment 1: Scanning Theory

**Professor:** Muhammed F. Mudawwar  
**Due Date:** Wednesday, September 25, 2002

- Write regular expressions for the following character sets
  - All strings of lowercase letters that begin and end in  $a$ .
  - All strings of one or more digits that contain no leading zeros.
  - All strings of one or more digits that represent even numbers.
  - All strings of  $a$ 's and  $b$ 's that contain no three consecutive  $b$ 's.
- Draw DFAs that accept the following:
  - Four reserved words **case**, **char**, **const**, and **continue**
  - All strings of  $a$ 's and  $b$ 's that contain an even number of  $a$ 's and an even number of  $b$ 's
  - $(a | (bc) *d) +$
- Write regular expressions that correspond to the following DFAs:

- Write a regular expression for a C comment surrounded by  $/*$  and  $*/$ . Individual  $/$  and  $*$  may appear inside the comment, but not  $*/$ .
- Use the variation of Thompson's construction, described in the lecture notes, to convert the regular expression  $(aa | b) * (a | bb) *$  into an NFA.
  - Convert the NFA of part (a) into a DFA using the subset construction method.
  - Minimize the DFA obtained in part (b).
