 Quiz#6-Sect.24
 Chapter 23

Instructor: Dr. A. Mekki

Name:

Key

Id:

Consider a very long line charge distribution of $\lambda_1 = -2.0 \text{ nC/m}$ and a point charge $q = 5 \text{ nC}$ as shown in the figure.

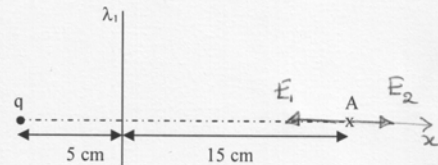

- (a) What is the magnitude and direction of the net electric field at point A located as shown?

$$\vec{E} = \vec{E}_2 - \vec{E}_1$$

$$= \frac{kq}{r_2^2} \hat{i} - \frac{2k\lambda}{r_1} \hat{i}$$

$$= \frac{9 \times 10^9 \times 5 \times 10^{-9}}{(0.2)^2} \hat{i} - \frac{2 \times 9 \times 10^9 \times 2 \times 10^{-9}}{0.15} \hat{i}$$

$$= 1125 \hat{i} - 240 \hat{i} = 885 \hat{i} \left(\frac{\text{N}}{\text{C}} \right)$$

- (b) What is the electric flux through a Gaussian surface centered on the point charge q having a radius of 3 cm?

$$\phi = \frac{q_{\text{enc}}}{\epsilon_0} = \frac{q}{\epsilon_0} = \frac{5 \times 10^{-9}}{8.85 \times 10^{-12}} = 565 \frac{\text{N} \cdot \text{m}^2}{\text{C}}$$
