

Consider inelastic collision

$$M = \gamma 2m_0 > 2m_0 !!!$$

increase in
mass:

$$\Delta M = M - 2m_0 = \frac{2K}{c^2} = \frac{2}{c^2} (\gamma - 1) m_0 c^2$$

\Rightarrow Conversion of K.E. into mass !!!

Applications:

$$Q = [M - (M_1 + M_2 + M_3)] c^2 = \Delta mc^2$$

↑ disintegration energy

$$\sum m_i c^2 \rightarrow Mc^2 + \underline{\text{B.E}}$$
