

56. Since the force acts tangentially at  $r = 0.10$  m, the angular acceleration (presumed positive) is

$$\alpha = \frac{\tau}{I} = \frac{Fr}{I} = \frac{(0.5t + 0.3t^2)(0.10)}{1.0 \times 10^{-3}} = 50t + 30t^2$$

in SI units ( $\text{rad/s}^2$ ).

(a) At  $t = 3$  s, the above expression becomes  $\alpha = 420 \text{ rad/s}^2$ .

(b) We integrate the above expression, noting that  $\omega_o = 0$ , to obtain the angular speed at  $t = 3$  s:

$$\omega = \int_0^3 \alpha dt = (25t^2 + 10t^3) \Big|_0^3 = 5.0 \times 10^2 \text{ rad/s} .$$
