

1. One reason that atomic masses are not integral multiples of the mass of a proton is that nuclei of an element differs in numbers of:
 - A. Positrons
 - B. Atomic number
 - C. Neutrons
 - D. Mass number
 - E. None of the above

2. The two important elements in the Periodic table are Silicon (Si) and Germanium (Ge) in the fabrication of microprocessor of the computer nowadays, are classified in the Periodic Table as:
 - A. Metallic elements
 - B. Nonmetallic elements
 - C. Transition metal elements
 - D. Metalloid elements
 - E. Halogen elements
