## *Lecture 3*

### *Review of Probability & random variables*

**Dr. Samir Al-Amer**

# Lecture Outlines

---

- ✦ Probability
- ✦ Probability of multiple events
  - Independent events
  - Mutually exclusive events
  - Non- Mutually exclusive events
- ✦ Mean and variance
- ✦ Continuous variable

# Probability

✦ Let

- $X$  be an event occurring as a result of some experiments or trials
- $n_x$  : # of trials resulting in  $X$
- $n$  : total # of trials

$$\text{Probability of } X = p(X) = \lim_{n \rightarrow \infty} \frac{n_x}{n}$$

Conduct an infinite number of trials

$$\text{Probability of } X = \frac{\text{\# of trials resulting in } X}{\text{total number of trials}}$$

# Probability

Alternative definition/ more practical

✦ Let

- $X$  be an event occurring as a result of some experiments or trials
- $N$  : # of all possible outcomes (size of sample space)
- $N_x$  : # of outcomes favorable to  $X$

$$\text{Probability of } X = p(X) = \frac{N_x}{N}$$

- Tossing a fair coin
- Two possible outcomes  $\{H, T\}$
- $X =$  getting a head  $\{H\}$  in first trial
- $N=2, N_x=1 \quad p(X)=0.5$

# Probability Example

- ✦ When a die is tossed
- ✦ Sample space = {1,2,3,4,5,6}
- ✦ Let  $X$  be the occurrence of '4'
- ✦  $N=6$
- ✦  $N_x=1$
- ✦  $p(4)=1/6$

# Probability Example

- ✦ When a die is tossed **once**
- ✦ Sample space = {1,2,3,4,5,6}
- ✦ Let  $X$  be the occurrence of an even number ( 2 , 4 or 6)
- ✦  $N=6$
- ✦  $N_x=3$
- ✦  $p(\text{even})=3/6 =0.5$

# Probability of Multiple Events

- ✦ Independent events
- ✦ Mutually exclusive events
- ✦ Non- Mutually exclusive events

# Probability of Independent Events

✦ Two events  $X$  and  $Y$  are **independent** if the occurrence of  $X$  does not affect the probability of  $Y$  and vice versa

✦ If  $X$  and  $Y$  are independent then

$$p(X \text{ and } Y) = p(X) p(Y)$$

Probability of  $X$  and  $Y$

# Probability of Independent Events

Two dice are tossed.

What is the probability that '3' appears twice?

- X : '3' appears at the top of the first die
- Y : '3' appears at the top of the second die
- X and Y are independent

$$P(X \text{ and } Y) = P(X) P(Y)$$

$$P(3) = 1/6$$

$$P(3 \text{ and } 3) = P(3)P(3) = 1/36$$

# Probability of Independent Events

✦ If  $X_1, X_2, \dots, X_m$  are **independent**

then

$$P(X_1 X_2 \dots X_m) = P(X_1) P(X_2) \dots P(X_m)$$

# Notation

---

$p(X | Y)$  = probability of occurrence of event  
X knowing that Y occurred

If X and Y are independent  $\Rightarrow$

$$p(X | Y) = p(X)$$

$$p(Y | X) = p(Y)$$

# Probability of Dependent Events

✦  $p(XY)=p(X)p(Y|X)$

✦ Probability of X and Y is the product of probability of X times the probability of Y given that X occurred

✦ X: first ball taken is blue

✦ Y: Second ball taken is blue

✦  $P(X)=2/6$

✦  $P(Y|X)=1/5$

✦  $P(XY)=(2/6)(1/5)$

# Probability of Mutually Exclusive Events

- ✦ Two events  $X$  and  $Y$  are **mutually exclusive** if the occurrence of  $X$  precludes the occurrence of  $Y$  and vice versa.
- ✦  $X$  and  $Y$  can not occur at the same time
- ✦  $p(X+Y)$ : the probability of occurrence of  $X$  or  $Y$
- ✦  $p(X+Y) = p(X) + p(Y)$

# Probability of Non-Mutually Exclusive Events

If X and Y are non-mutually exclusive  
then

$$p(X+Y)=p(X)+p(Y)-p(XY)$$

What is the probability one '2' appears in  
two-dice toss?

## Alternative Notation

---

$$p(XY) = p(X \cap Y)$$

$$P(XYZ) = P(X \cap Y \cap Z)$$

$$p(X+Y) = p(X \cup Y)$$

$$p(X+Y+Z) = p(X \cup Y \cup Z)$$

# DeMorgan's Laws

---

$$\overline{(X \cup Y)} = \bar{X} \cap \bar{Y}$$

$$\overline{(X \cap Y)} = \bar{X} \cup \bar{Y}$$

$$X \cap (Y \cup Z) = (X \cap Y) \cup (X \cap Z)$$

$$X \cup (Y \cap Z) = (X \cup Y) \cap (X \cup Z)$$

# Random Variables

# Random Variables

✦ **Random variables** are real valued functions whose domain is the sample space.

Example:

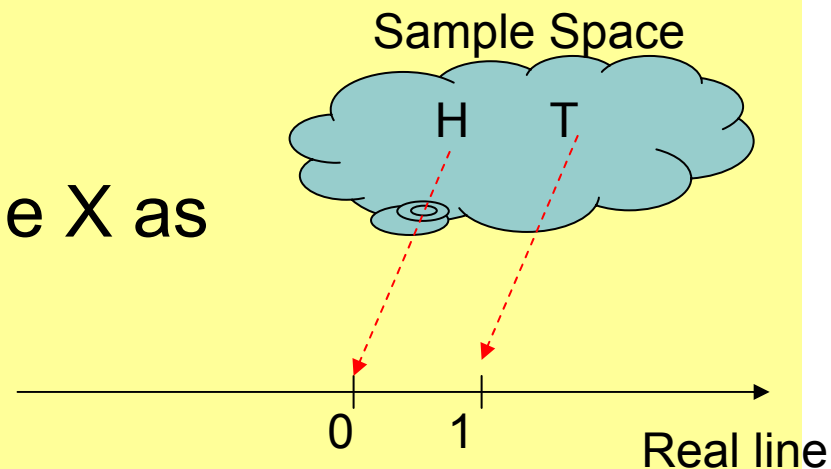

Toss a coin

Sample Space = {H, T}

Define the random variable  $X$  as

$X(H) = 0$

$X(T) = 1$

# Random Variables

## Notation

---

- ✦ Capital letters are used for **Random variables**
- ✦ Lower case letters are used for the values a random variable takes.

Example:  $p(X=x)$

The probability that the random variable  $X$  is equal to  $x$ .

$p(X=1)=?$  0.5 if we have a fair coin

# Random Variables

Example:

4 dice are tossed

$x$  = # of appearance of '5' on the top of four dice toss.

There are four possible values that  $x$  can take 0,1,2,3 and 4

$X$  is a **random variable**. It is a number that is assigned to each possible events

## Example

Define  $F(x)$  as the frequency of occurrence of the event associated with  $x$

Four dice are tossed 100 times

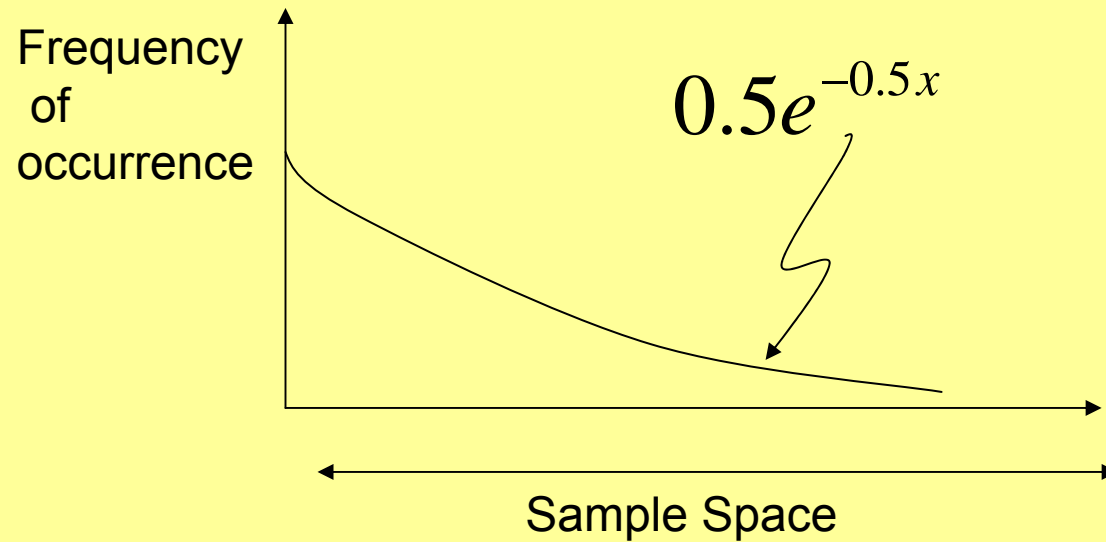

# Random Variables

## Example

✦  $X = \text{life length of a transistor} = \{x | 0 \leq x \leq \infty\}$

✦

# Continuous Random Variable

- ✦ A random variable is continuous if it takes on the infinite number of possible values associated with intervals of real numbers

# Probability Functions

---

## Probability Density Function

$$p(x)$$

### Properties

$$p(x) \geq 0$$

$$p(-\infty) = 0$$

$$p(\infty) = 0$$

$$p(a \leq x \leq b) = P(b) - P(a)$$

## Cumulative Distribution Function

$$P(x) = p(X \leq x)$$

### Properties

$$0 \leq P(x) \leq 1$$

$$P(-\infty) = 0$$

$$P(\infty) = 1$$

$$\frac{dP(x)}{dx} \geq 0$$

$$P(x) = \int_{-\infty}^x p(x) dx$$

# Mean and Variance

# Random Variables

Example:

4 dice are tossed

$x$  = # of appearance of '5' on the top of four dice toss.

There are four possible values that  $x$  can take 0,1,2,3 and 4

$X$  is a **random variable**. It is a number that is assigned to each possible events

## Example

$x$	$F(x)$	$xF(x)$	$x^2F(x)$
0	48	0	0
1	39	39	39
2	11	22	44
3	2	6	18
4	0	0	0
<hr/>			
Sums	100	67	101

# Mean and Variance

---

$$\text{Mean} = E\{x\} = \bar{x} = \frac{\sum xF(x)}{\sum F(x)}$$

$$\text{Variance} = E\{x^2\} = \frac{\sum (x - \bar{x})^2 F(x)}{\sum F(x)} = \lambda^2$$

standard deviation =  $\lambda$

$$\text{Third Central Moment} = \frac{\sum (x - \bar{x})^3 F(x)}{\sum F(x)}$$

# Mean and Variance

---

$$\text{Mean} = E\{x\} = \bar{x} = \int_{-\infty}^{\infty} x p(x) dx$$

$$E\{x^2\} = \int_{-\infty}^{\infty} x^2 p(x) dx$$

$$\text{Variance } V\{x\} = \sigma_x^2 = E\{(x - E\{x\})^2\} = E\{x^2\} - (E\{x\})^2$$

Properties of  $E\{.\}$

$$E\{aX\} = a E\{X\}$$

$$E\{aX + b\} = aE\{X\} + b$$

$$V\{aX + b\} = a^2V(X)$$

# Mean and Variance

## Example

---

$x$  is a random variable with  $p(z) = \begin{cases} e^{-z} & z > 0 \\ 0 & z < 0 \end{cases}$

$$E\{x\} = \int_{-\infty}^{\infty} x p(x) dx = \int_0^{\infty} x e^{-x} dx = 1$$

$$E\{x^2\} = \int_{-\infty}^{\infty} x^2 p(x) dx = \int_0^{\infty} x^2 e^{-x} dx = 2$$

$$\text{Variance } V\{x\} = E\{x^2\} - (E\{x\})^2 = 2 - 1 = 1$$
