Name: **Id#**
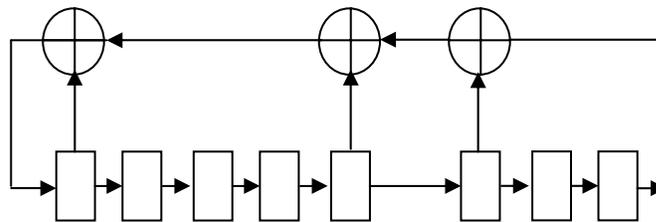

COE 205, Term 021

Computer Organization & Assembly Programming
Programming Assignment# 3

Due date: Monday, Dec. 16

You are required to write an 8086 assembly program to implmenet a pseudo random generator using Liner Feedback Shift Register (LFSR). An 8-bit LFSR is shown below:

The 8-bit LFSR shown above is guaranteed to generate a random sequence in the range from 1 to 255 before it repeats again. The register has to be initialized first by a seed, which can be any number other than 0. In your implementation use a seed of 10101010.

(i)   Write a subroutine, RAND8, that implements the pseudo random generator mentioned above. Every time RAND8 is called, it returns a new random number. The seed should be initialized outside the subroutine only once. The returned number should be stored on the stack.

(ii)   Write a subroutine that displays the content of an 8-bit register in decimal. The content of the register should be passed on the stack.

(iii)   Display in decimal using the subroutine in (i) the first 10 numbers generated by the above shown LFSR.

(iv)   Ask the user to enter a string of characters. Then, encrypt the string using RAND8 as follows. Each character is encrypted by XORing the least significant 4-bits of the ASCII code of the character with the lest significant 4 bits of the generated random number. For example, assume the character to be encrypted is A=41H and the random number is AAH. Then, the encrypted character will have the ASCII code 4BH = K. As an example show the encryption of the string Hello COE-205!!. Then, rerun your program giving it the encrypted string and it should correctly decrypt it to Hello COE-205!!.

Make sure that your program is well documented. Provide a hard copy of the program and a soft copy of both the assembly code and the executable stored in a floppy disk.
