## COMPUTER ENGINEERING DEPARTMENT

COE 205

## COMPUTER ORGANIZATION \& ASSEMBLY PROGRAMMING

## Major Exam I

Second Semester (082)
Time: 7:00-9:00 PM

Student Name : $\qquad$

Student ID. : $\qquad$

| Question | Max Points | Score |
| :---: | :---: | :---: |
| Q1 | $\mathbf{6 0}$ |  |
| Q2 | $\mathbf{1 0}$ |  |
| Q3 | $\mathbf{1 0}$ |  |
| Q4 | $\mathbf{2 0}$ |  |
| Total | $\mathbf{1 0 0}$ |  |

(Q1) Fill the blank in each of the following:
(1) There is one-to-one correspondence between machine language and
$\qquad$ -.
(2) $\qquad$ translate high-level programs to machine code.
(3) One of the main advantages of programming in high level languages is that programs are $\qquad$ .
(4) Programs written in assembly language have the advantage of being both
$\qquad$ and $\qquad$ efficient.
(5) $\qquad$ of a processor provides a hardware/software interface.
(6) The size of the address bus of the 8086 processor is $\qquad$ bits while it is $\qquad$ bits for the Pentium IV processor.
(7) With the Pentium processor having a 32 bit address bus and a 64 bit data bus, the physical address space is $\qquad$ bytes and the maximum number of bytes that can be transferred in a single read/write cycle is $\qquad$ bytes.
(8) $\qquad$ RAM is slower than $\qquad$ RAM but is denser and cheaper.
(9) $\qquad$ can help bridge the widening speed gap between CPU and main memory.
(10) Given a magnetic disk with the following properties: Rotation speed $=5400$ RPM (rotations per minute), Average seek $=6 \mathrm{~ms}$, Sector $=512$ bytes, Track = 256 sectors. The average time to access a block of 64 consecutive sectors is
(11) The integer number -4992 is represented in hexadecimal using 16-bit 2 's complement representation as $\qquad$ .
(12) Assume that $\mathrm{AX}=8411 \mathrm{~h}$ and $\mathrm{BX}=\mathrm{F} 857$. Executing the instruction $A D D A X$, $B X$ produces the following results: $\mathrm{AX}=$ , overflow flag= _ sign flag= $\qquad$ , zero flag= $\qquad$ , carry flag= $\qquad$ auxiliary flag= $\qquad$ and parity flag= $\qquad$ .
(13) Assume that $\mathrm{AX}=8411 \mathrm{~h}$ and $\mathrm{BX}=\mathrm{F} 857$. Executing the instruction $\operatorname{SUB} A X$, $B X$ produces the following results: $\mathrm{AX}=$ $\qquad$ , overflow flag= $\qquad$ , sign flag= $\qquad$ , zero flag= $\qquad$ , carry flag= $\qquad$ , auxiliary flag= $\qquad$ and parity flag= $\qquad$ .
(14) As part of the instruction set architecture of the Pentium-IV processor, it has
$\qquad$ general-purpose registers, $\qquad$ segment registers in addition to $\qquad$ and $\qquad$ registers.
(15) The $\qquad$ register holds the address of the next instruction to be fetched from memory.
(16) Given that the instruction MOV ECX, 1000 (having the machine code B9 000003E8) is stored at address 00000005 , then the address of the next instruction to be fetched from memory is $\qquad$ .
(17) In real addressing mode, assume that the code segment occupies the address range from 00000 to 010F5. The next available free segment is $\qquad$ .
(18) Assume that DS=10AF, CS=4FE5, ES=F030, SS=E123, IP=0059, BX=1055, and SI=577F. Based on 16-bit real-mode addressing, the linear address of the next instruction to be fetched from memory is
(19) Assume that $\mathrm{DS}=10 \mathrm{AF}, \mathrm{CS}=4 \mathrm{FE} 5, \mathrm{ES}=\mathrm{F} 030$, $\mathrm{SS}=\mathrm{E} 123, \mathrm{IP}=0059, \mathrm{BX}=1055$, and $\mathrm{SI}=577 \mathrm{~F}$. Based on 16 -bit real addressing mode, the linear address of the source operand in the instruction MOV AX , [SI] is .
(20) In protected mode, $\qquad$ translates logical address to linear address while $\qquad$ translates linear address to physical address.
(21) $\qquad$ provide information to the assembler while translating a program and are non-executable.
(22) The assembler allocates $\qquad$ bytes for the variable Array defined below:
Array DWORD 5, $5 \operatorname{dup}(5,5 \operatorname{dup}(0))$
(23) Assuming the following data segment, and assuming that variable X is given the linear address 00404000 h , then the linear address for variables Y and Z will be
$\qquad$ and $\qquad$ .

## .DATA

X BYTE 10, 11, 12, 13, 14
Y WORD 15
ALIGN 4
Z DWORD 16
(24) Assuming the following data segment, and assuming that variable $X$ is given the linear address 00404000 h , then the content of register EAX after executing the instruction MOV EAX, OFFSET Y-2 is $\qquad$ —.

```
.DATA
X BYTE "COE205", 10, 13
    WORD 1, 2, 3, 4
Y DWORD 16
```

(25) After executing the code given below, the content of registers EAX and EBX will be $\qquad$ and $\qquad$ _.
.DATA ARRAY DWORD -1,50, 0FEh, -200, 1010b, 0ABCDh
.CODE
MOV EAX, LENGTHOF ARRAY MOV EBX, SIZEOF ARRAY
(26) After executing the code given below, the content of register EAX will be
$\qquad$ .
.DATA
ARRAY BYTE $1,2,3,4,5,6,7,8$
.CODE
MOV EAX, DWORD PTR ARRAY
(27) Assuming variable ARRAY is defined as shown below:

ARRAY WORD 1, 2, 3, 4, 5, 6, 7, 8
The content of register AX after executing the instruction MOV AX, ARRAY+3 will be $\qquad$ .
(28) The addressing mode of the source operand in the instruction MOV EAX, offset ARRAY +4 is $\qquad$ —.
(29) The addressing mode of the source operand in the instruction MOV EAX, ARRAY+20[EBX*2-4] is $\qquad$ .
(30) Assume that $A X=50 \mathrm{~A} 3 \mathrm{~h}$. Executing the instruction MOVSX EBX, AL produces the result $\mathrm{EBX}=$ $\qquad$ .
(31) After executing the code shown below, the content of register EAX will be
$\qquad$ and the content of register ECX will be $\qquad$ .

MOV ECX, 10
MOV EAX, 0
NEXT:
ADD EAX, ECX
LOOP NEXT
(32) Considering the code below, the value stored in the address field for NEXT in the LOOP instruction is $\qquad$ .

| Offset $\quad$ Machine Code |  | Source Code |
| :--- | :--- | :--- |
| 00000000 | B9 00000004 |  |
| 00000005 B8 00000002 |  | MOV ECX, 4 |
| 0000000A | NEXT: |  |
| 0000000A 03 C0 |  | ADD EAX, EAX |
| 0000000C 40 | INC EAX |  |
| 0000000D E2 ?? |  | LOOP NEXT |

(33) Considering the code below, the content of register AX after executing the code will be $\qquad$ .
.DATA
ARRAY WORD $1,2,3,4,5$
WORD 6, 7,8, 9, 10
WORD 11, 12, 13, 14, 15
WORD 16, 17, 18, 19, 20
RSIZE EQU SIZEOF ARRAY
.CODE
MOV ESI, 3 *RSIZE
MOV EDI, 4
MOV AX, ARRAY[ESI+EDI*TYPE ARRAY]
(Q2) Consider a program that has the following data segment assuming a flat memory model:

| $I$ | $E Q U$ | 1 |
| :--- | :--- | :--- |
| $J$ | $E Q U$ | $A X$ |

K BYTE 10
$L$ WORD I+10
Indicate whether the following are valid IA-32 instructions or not. If invalid, give the reason:

1. MOV AX, L-1
2. MOV AX, offset K+1
3. MOV DS, J
4. MOV ES, K
5. MOV [2*EAX+EAX], 20
6. SUB [ESI*4], AX
7. MOV EAX, OFFSET L[EBX]
8. MOV EAX, DWORD PTR BX
9. MOVSX EAX, AL
10. MOV [EAX+ESI], L
(Q3) Suppose that the following directives are declared in the data segment with a starting linear address of 00404000. Show the linear addresses of allocated memory and their corresponding content in hexadecimal. Note that the ASCII code for character ' $a$ ' is 61 h and that of character ' A ' is 41 h . The ASCII code of character ' 0 ' is 30 h .
I BYTE -20, '20’

WORD 20
J DWORD 0FEh
K EQU 67H
L BYTE K-5
BYTE 2, $2 \operatorname{dup}\left(2,{ }^{\prime}{ }^{\prime}\right.$ ’)

| Variable | Linear Address (Hex.) | Content (Hex.) |
| :---: | :---: | :---: |
| I | 00404000 |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |

(Q4) Assume that you have a two-dimensional array of integers, declared as Array, with each integer defined as a DWORD. Write an assembly program to swap the content of any two columns assuming that the two column numbers to be swapped are stored in registers AL and AH . Assume that the number of rows and number of columns in the array are defined in the constants NRow and NCol, respectively. Your program should work for any array size.

For example, assume the following array definition:
NRow EQU 4
NCol EQU 5
Array DWORD 1, 2, 3, 4, 5
DWORD 6, 7, 8, 9, 10
DWORD 11, 12, 13, 14, 15
DWORD 16, 17, 18, 19, 20
After executing the program assuming $\mathrm{AH}=1$ and $\mathrm{AL}=2$, the content of Array will be:
Array $\quad$ DWORD 1, 3, 2, 4, 5
DWORD 6, 8, 7, 9, 10
DWORD 11, 13, 12, 14, 15
DWORD 16, 18, 17, 19, 20
