h. For the logic circuit shown below, assuming that all gates have the same propagation delay of $\mathbf{2} \mathbf{n s}$, then the circuit takes $\qquad$ ns to produce the correct output.
[2 points]

Solution:
The worst-case propagation delay from input to output is the delay of the path containing the maximum number of logic gates, since all gates have the same propagation delay. This path is: AND-OR-AND-OR
The mentioned path contains 4 logic gates each with propagation delay of 2 ns . So, the circuit takes $4 \times 2=\mathbf{8}$ ns to produce the correct output.
