## Quiz\# 1

Date: Sunday, Sep. 6, 2015

Q1. Determine the decimal value of the following numbers:
i. $(11011100.011)_{2}$
ii. $(2 \mathrm{~A} . \mathrm{C})_{16}$

Q2. Represent the following numbers in binary. Use as many bits as needed, and use only $\mathbf{4}$ binary digits to represent the fraction:
i. $(499.7)_{10}$
ii. (E3.5) ${ }_{16}$

Q3. Perform the following arithmetic operations in the given bases:

## i. $\quad(01110111)_{2}+(\mathbf{0 1 0 1 1 0 1 1})_{2}$

ii. (A2) $\left.\mathbf{1 6}^{-(8 E}\right)_{16}$
iii. (5E) $\mathbf{1 6}^{*}$ * (32) ${ }_{16}$

Q4. Fill in the Spaces: (Show all work needed to obtain your answer)
a. Given that the base R number $(222)_{\mathrm{R}}$ is equal to $(62)_{10}$. Then the base $\mathrm{R}=$ $\qquad$ .
b. The largest unsigned decimal value that can be expressed using 6 binary integer digits and 2 binary fractional digits is $\qquad$ .
c. The number $\mathbf{5 3}$ is represented in $\mathbf{B C D}$ as $\qquad$ .
d. Given that an 8-bit register stores the ASCII code of a character in the least significant 7 bits and a parity bit in the most significant bit. Assuming that the register contains the hexadecimal value C4 representing a character, the character stored in the register is $\qquad$ and the parity used is
$\qquad$ (i.e. even or odd parity). Note that the ASCII code of character 'A' is 41h and the ASCII code of character ' $a$ ' is 61 h .
