## Problem Session #3

### <u>Prob 3.15:</u> Determine the gradient of the following scalar fields:

Since 
$$\nabla U = \frac{\partial U}{\partial x} \overline{a_x} + \frac{\partial U}{\partial y} \overline{a_y} + \frac{\partial U}{\partial z} \overline{a_z}$$

$$\vec{\nabla} U = 4z^2 \, \vec{a_x} + 3z \, \vec{a_y} + (8xz + 3y) \vec{a_z}$$

$$\vec{\nabla} \cdot V = e^{(2x+3y)} \left[ 2\cos 5z \ \vec{a_x} + 3\cos 5z \ \vec{a_y} - 5\sin 5z \ \vec{a_z} \right]$$

$$\vec{\nabla} \cdot V = e^{(2x+3y)} [2\cos 5z \ \vec{a}_x + 3\cos 5z \ \vec{a}_y - 5\sin 5z \ \vec{a}_z]$$
e)  $W = 2\rho(z^2 + 1)\cos \phi$ 

$$\vec{\nabla} \cdot W = 2(z^2 + 1)\cos \phi \vec{a}_\rho - 2(z^2 + 1)\sin \phi \vec{a}_\phi + 4\rho z \cos \phi \vec{a}_z$$
d)  $T = 5\rho e^{-2z} \sin \phi$ 

$$\vec{\nabla} \cdot T = 5e^{-2z} [\sin \phi \vec{a}_\rho + \cos \phi \vec{a}_\phi - 2\rho \sin \phi \vec{a}_z]$$
e)  $H = r^2 \cos \theta \cos \phi$ 

$$\vec{\nabla} T = 5e^{-2z} \left[ \sin \phi \vec{a}_{o} + \cos \phi \vec{a}_{o} - 2\rho \sin \phi \vec{a}_{z} \right]$$

$$\vec{\nabla} H = 2r\cos\theta\cos\phi \vec{a_r} - r\sin\theta\cos\phi \vec{a_\theta} - r\cos\theta\sin\phi \vec{a_\phi}$$

f) 
$$Q = (\sin \theta \sin \phi) / r^3$$

Since 
$$\nabla U = \frac{\partial U}{\partial x} \overline{a_x} + \frac{\partial U}{\partial y} \overline{a_y} + \frac{\partial U}{\partial z} \overline{a_z}$$

a)  $U = 4xz^2 + 3yz$ 

$$\nabla U = 4z^2 \overline{a_x} + 3z \overline{a_y} + (8xz + 3y)\overline{a_z}$$

b)  $V = e^{(2x+3y)} \cos 5z$ 

$$\nabla V = e^{(2x+3y)} [2\cos 5z \overline{a_x} + 3\cos 5z \overline{a_y} - 5\sin 5z \overline{a_z}]$$

$$V = e^{(2x+3y)} [2\cos 5z \overline{a_x} + 3\cos 5z \overline{a_y} - 5\sin 5z \overline{a_z}]$$

Since 
$$\overline{\nabla} = \frac{\partial}{\partial x} \overline{a_x} + \frac{\partial}{\partial y} \overline{a_y} + \frac{\partial}{\partial z} \overline{a_z}$$

a) 
$$A = \underbrace{e^{xy}}_{Ax} \overline{a}_x + \underbrace{\sin xy}_{Ay} \overline{a}_y + \underbrace{\cos^2 xz}_{Ay} \overline{a}_z$$

Divergence of 
$$A = \vec{\nabla} \cdot \vec{A} = \frac{\partial A_x}{\partial x} + \frac{\partial A_y}{\partial y} + \frac{\partial A_z}{\partial z}$$

$$\Rightarrow \vec{\nabla} \cdot \vec{A} = ye^{xy} + x\cos xy - 2x\cos(xz)\sin(xz)$$

$$\overrightarrow{\nabla} \cdot \overrightarrow{A} = ye^{xy} + x\cos xy - 2x\cos(xz)\sin(xz)$$
and 
$$\underbrace{\nabla \cdot \overrightarrow{A}}_{\text{out}} = \underbrace{\begin{bmatrix} 5 \text{ Az} \\ 5y \end{bmatrix}}_{\text{out}} - \underbrace{\begin{bmatrix} 5 \text{ Az} \\ 5y \end{bmatrix}}_{\text{out}} = \underbrace{\begin{bmatrix} 5 \text{ Az} \\ 5y \end{bmatrix}}_{\text{out}} - \underbrace{\begin{bmatrix} 5 \text{ Az} \\ 5y \end{bmatrix}}_{\text{out}} = \underbrace{\begin{bmatrix} 5 \text{ Az} \\ 5y \end{bmatrix}}_{\text{out}} - \underbrace{\begin{bmatrix} 5 \text{ Az} \\ 5y \end{bmatrix}}_{\text{out}} = \underbrace{\begin{bmatrix} 5 \text{ Az} \\ 5y \end{bmatrix}}_{\text{out}} - \underbrace{\begin{bmatrix} 5 \text{ Az} \\ 5y \end{bmatrix}}_{\text{out}} = \underbrace{\begin{bmatrix} 5 \text{ Az} \\ 5y \end{bmatrix}}_{\text{out}} - \underbrace{\begin{bmatrix} 5 \text{ Az} \\ 5y \end{bmatrix}}_{\text{out}} = \underbrace{\begin{bmatrix} 5 \text{ Az} \\ 5y \end{bmatrix}}_{\text{out}} - \underbrace{\begin{bmatrix} 5 \text{ Az} \\ 5y \end{bmatrix}}_{\text{out}} = \underbrace{\begin{bmatrix} 5 \text{ Az} \\ 5y \end{bmatrix}}_{\text{out}} - \underbrace{\begin{bmatrix} 5 \text{ Az} \\ 5y \end{bmatrix}}_{\text{out}} = \underbrace{\begin{bmatrix} 5 \text{ Az} \\ 5y \end{bmatrix}}_{\text{out}} - \underbrace{\begin{bmatrix} 5 \text{ Az} \\ 5y \end{bmatrix}}_{\text{out}} = \underbrace{\begin{bmatrix} 5 \text{ Az} \\ 5y \end{bmatrix}}_{\text{out}} - \underbrace{\begin{bmatrix} 5 \text{ Az} \\ 5y \end{bmatrix}}_{\text{out}} = \underbrace{\begin{bmatrix} 5 \text{ Az} \\ 5y \end{bmatrix}}_{\text{out}} - \underbrace{\begin{bmatrix} 5 \text{ Az} \\ 5y \end{bmatrix}}_{\text{out}} = \underbrace{\begin{bmatrix} 5 \text{ Az} \\ 5y \end{bmatrix}}_{\text{out}} - \underbrace{\begin{bmatrix} 5 \text{ Az} \\ 5y \end{bmatrix}}_{\text{out}} = \underbrace{\begin{bmatrix} 5 \text{ Az} \\ 5y \end{bmatrix}}_{\text{out}} - \underbrace{\begin{bmatrix} 5 \text{ Az} \\ 5y \end{bmatrix}}_{\text{out}} = \underbrace{\begin{bmatrix} 5 \text{ Az} \\ 5y \end{bmatrix}}_{\text{out}} - \underbrace{\begin{bmatrix} 5 \text{ Az} \\ 5y \end{bmatrix}}_{\text{out}} = \underbrace{\begin{bmatrix} 5 \text{ Az} \\ 5y \end{bmatrix}}_{\text{out}} - \underbrace{\begin{bmatrix} 5 \text{ Az} \\ 5y \end{bmatrix}}_{\text{out}} = \underbrace{\begin{bmatrix} 5 \text{ Az} \\ 5y \end{bmatrix}}_{\text{out}} - \underbrace{\begin{bmatrix} 5 \text{ Az} \\ 5y \end{bmatrix}}_{\text{out}} = \underbrace{\begin{bmatrix} 5 \text{ Az} \\ 5y \end{bmatrix}}_{\text{out}} - \underbrace{\begin{bmatrix} 5 \text{ Az} \\ 5y \end{bmatrix}}_{\text{out}} = \underbrace{\begin{bmatrix} 5 \text{ Az} \\$$

$$\vec{\nabla} \times \vec{A} = (0 - 0)a_x + (0 + 2z\cos(xz)\sin(xz))a_y + (y\cos(xy) - xe^{xy})a_z$$

$$= 2z\cos(xz)\sin(xz)\vec{a}_y + (y\cos(xy) - xe^{xy})\vec{a}_z$$

b) 
$$B = \rho z^2 \cos \phi \, \overline{a_\rho} + z \sin^2 \phi \, \overline{a_z}$$

$$\vec{\nabla} \bullet \vec{B} = \frac{1}{\rho} \frac{\partial}{\partial \rho} (\rho^2 z^2 \cos \phi) + 0 + \sin^2 \phi$$
$$= 2z^2 \cos \phi + \sin^2 \phi$$

and 
$$\vec{\nabla} \times \vec{B} = \frac{z \sin \phi}{\rho} \vec{a}_{\rho} + 2\rho z \cos \phi \vec{a}_{\phi} + z^2 \sin \phi \vec{a}_{z}$$

Prob 3.18(c): 
$$C = r \cos \theta \, a_r - \frac{1}{r} \sin \theta \, a_\theta + 2r^2 \sin \theta \, a_\phi$$

$$\vec{\nabla} \cdot \vec{C} = \frac{1}{r^2} \frac{\partial}{\partial r} (r^3 \cos \theta) + \frac{1}{r \sin \theta} \frac{\partial}{\partial \theta} (\frac{-1}{r} \sin^2 \theta) + 0 = 3 \cos \theta - \frac{2 \cos \theta}{r^2}$$

and 
$$\vec{\nabla} \times \vec{C} = 4r \cos\theta \, \vec{a}_r - 6r \sin\theta \, \vec{a}_\theta + \sin\theta \, \vec{a}_\phi$$

<u>Prob 3.30(a)</u>: Given that  $E = \frac{1}{r^4} \sin^2 \phi \ \overline{a_r}$ , Evaluate the following over the region between the spherical surfaces r = 2 and r = 4.

$$ds = \int_{s}^{ds} dS \int_{s}^{ds} dS \int_{outler}^{ds} = r^{2} \sin\theta \, d\theta \, d\phi \, \bar{a}_{r}$$

$$dS_{inner} = -r^{2} \sin\theta \, d\theta \, d\phi \, \bar{a}_{r}$$

$$\oint_{S} E \bullet dS = \int_{inner} E \bullet dS_{inner} + \int_{outter} E \bullet dS_{outter} = \frac{-r_{n}^{2}}{r_{n}^{4}} \int_{0}^{2\pi \pi} \sin^{2}\phi \sin\theta d\theta d\phi + \frac{r_{oet}^{2}}{r_{oet}^{4}} \int_{0}^{2\pi \pi} \sin^{2}\phi \sin\theta d\theta d\phi$$

$$=\left(\frac{1}{4} - \frac{1}{2^{*}}\right) \int_{0}^{2\pi} \sin^{2}\phi \, d\phi \int_{0}^{\pi} \sin \theta \, d\theta = \left(\frac{1}{4} \cdot \frac{-3}{4}\right) \cdot \left(\pi\right) \left(2\right) = \frac{-3\pi}{8}$$

#### **Prob 3.30(b):**

$$\int_{V} (\nabla \cdot E) dv$$
Since  $\vec{\nabla} \cdot \vec{E} = \frac{1}{r^2} \frac{\partial}{\partial r} (\frac{1}{r^2} \sin^2 \phi) = \frac{-2}{r^5} \sin^2 \phi$ 

$$\int_{0}^{\infty} \vec{E} dv = -2 \int_{0}^{2\pi} \int_{0}^{4} \frac{1}{r^3} \sin^2 \phi \sin \theta dr d\theta d\phi$$

$$= -2(\pi)(2) \frac{1}{2} (\frac{1}{4^2} - \frac{1}{2^2}) = -2\pi \cdot \frac{+3}{16} = \frac{-3\pi}{2}$$

#### Calculate the total outward flux of vector Prob 3.33: $F = \rho^2 \sin \phi \, a_\rho + z \cos \phi \, a_\phi + \rho z \, a_z$ through the hollow cylinder defined by $2 \le \rho \le 3, 0 \le z \le 5$

$$\psi_{inner} = -\int_{0}^{5} \int_{0}^{2\pi} \rho^{3} \sin \phi \, d\phi \, dz = 0 \text{ (Since } 0 \le \phi \le 2\pi)$$

$$(\text{at } \rho = 2)$$

$$\psi_{outter} = \int_{0}^{5} \int_{0}^{2\pi} \rho^{3} \sin \phi \, d\phi \, dz = 0 \text{ (Since } 0 \le \phi \le 2\pi)$$

$$(\text{at } \rho = 3)$$

$$\psi_{outter} = \int_{0}^{5} \int_{0}^{2\pi} \rho^{3} \sin \phi \, d\phi \, dz = 0 \, (Since \, 0 \le \phi \le 2\pi)$$

$$(at \, \rho = 3)$$

So, 
$$\psi_{total} = \frac{190\pi}{3}$$

But the total outward flux can be found as the following:

$$\int\limits_V (\nabla \bullet F) dv \text{ where, } dv = \rho d\rho d\phi dz \text{ (divergence theorem)}$$

$$\Rightarrow \int_{0}^{2\pi 5} \int_{0}^{3} (\vec{\nabla} \cdot \vec{F}) \rho \, d\rho \, d\phi \, dz = \frac{190\pi}{3}$$

### Given the vector field

$$\overline{R} = (2x^2y + yz)\overline{a}_x + (xy^2 - xz^3)\overline{a}_y + (\mathbf{c}xyz - 2x^2y^2)\overline{a}_z$$

Determine the value of c for R to be solenoid.

To be solenoid, that means  $\vec{\nabla} \cdot \vec{R} = 0$ 

$$\Rightarrow \vec{\nabla} \bullet \vec{R} = 4xy + 2xy + cxy = 0$$

$$\Rightarrow C = -6$$

#### Problem # 3.40 If the vector field

Problem # 3.40 If the vector field
$$T = (\alpha xy + \beta z^3) \overline{a}_x + (3x^2 - \gamma z) \overline{a}_y + (3xz^2 - y) \overline{a}_z$$

is irrotational, determine

 $\alpha$ ,  $\beta$ , and  $\gamma$ . Find  $\nabla \bullet T$  at (2,-1,0)

$$\vec{\nabla} \times \vec{T} = (-1 + \gamma) \vec{a}_x + (3\beta z^2 - 3z^2) \vec{a}_y + (6x - \alpha x) \vec{a}_z = 0$$

$$\alpha = 6$$
,  $\beta = 1$  and  $\gamma = 1$ 

Again 
$$\nabla$$
.  $\overline{\uparrow}$   $\Rightarrow$  Solve it. (See problem 3.18(a))

$$as, \ \overrightarrow{\nabla} X \overrightarrow{T} = \begin{vmatrix} a_x & a_y & a_{\lambda} \\ \frac{5}{5z} & \frac{5}{5z} & \frac{5}{5z} \\ T_x & T_y & T_z \end{vmatrix}$$
