

Assignment #2

Objective: Learn about HTML forms, server-side scripting (using Microsoft's Razor), using .NET TcpClient class, and HTTP client-server communication.

1. Use WebMatrix to develop a script "**ImageFetch.cshtml**". The script presents a form to the user. The user types in the absolute URL for some image file. Upon submission, the image is somehow fetched and displayed below the form (and not in a new page).
2. The page has an `<iframe src= "ImageFetch.cshtml?FetchSrc" >` to have the browser fetch and display the raw content of "**ImageFetch.cshtml**". The content needs to be sent as *content-type:text/plain*.

Submission & Deadline: Host your code (live) on the web; e-mail its URL by Sep. 19, 2015.

Important Note: Your solution is to modify "**HttpClient.cshtml**" discussed in class. In other words, you have to use .NET TcpClient for (1) above.
