

# 16. Logical Programming

## Logic Programming

---

- ◆ Neither imperative nor functional
- ◆ Deals with relations, not functions
  - ▶ Arguments and results are treated uniformly
  - ▶ `daughter(sue,john)`
  - ▶ `lessthan(3,10)`
- ◆ Separate logic from control
  - ▶ Programmer declares what facts and relations are true
  - ▶ System determines how to use facts to solve problems

## Relations (Predicates)

---

- ◆ A table with  $n \geq 0$  columns and a possibly infinite set of rows
- ◆ A tuple  $(a_1, a_2, \dots, a_n)$  is in a relation if  $a_i$  appears in column  $i$ ,  $1 \leq i \leq n$
- ◆ Example: Relation *append* is a set of tuples of the form  $(X, Y, Z)$ , where  $Z$  consists of the elements of  $X$  followed by the elements of  $Y$
- ◆ Relations can be specified using Horn clauses (rules)

## Horn Clauses (Rules)

---

- ◆ A Horn clause:

$P$  if  $Q_1$  and  $Q_2$  and ... and  $Q_k$ ,  $k \geq 0$

can be interpreted as:

The consequent,  $P$ , is true if the antecedents  $Q_1, Q_2, \dots, Q_k$ ,  $k \geq 0$  are all true

- Antecedents: conjunction of zero or more conditions that are atomic formulae in predicate logic
- Consequent: an atomic formula in predicate logic

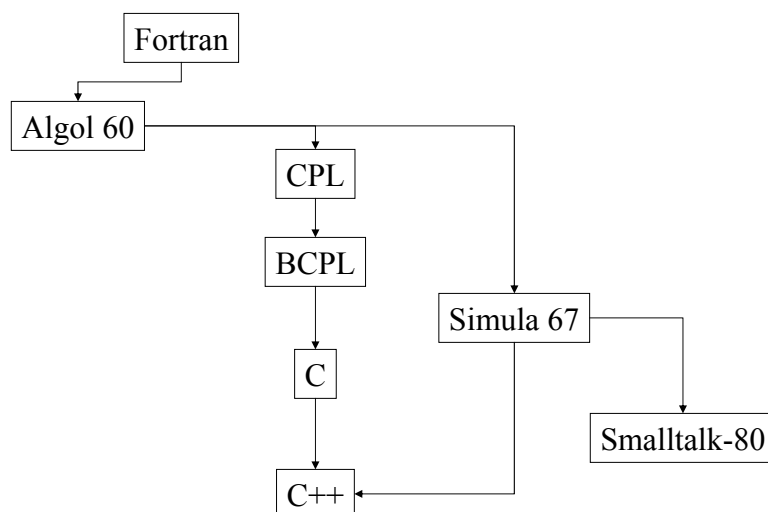

## Horn Clause Terminology

---

- ◆ Horn Clause  $\Leftrightarrow$  Clause
- ◆ Consequent  $\Leftrightarrow$  Goal  $\Leftrightarrow$  Head
- ◆ Antecedents  $\Leftrightarrow$  Subgoals  $\Leftrightarrow$  Tail
- ◆ Horn clause with no tail  $\Leftrightarrow$  Fact
- ◆ Horn clause with tail  $\Leftrightarrow$  Rule
- ◆  $P \text{ if } Q_1 \text{ and } Q_2 \text{ and } \dots \text{ and } Q_k \Leftrightarrow p :- q_1, \dots, q_n$

## Example: Links Between Languages

---

## Example Prolog Facts and Rules

---

- ◆ A prolog program starts with a collection of facts

```
link(fortran, algol60)
link(algol60, cpl)
link(cpl, bcpl)
link(bcpl, c)
link(c, cplusplus)
link(algol60, simula67)
link(simula67, cplusplus)
link(simula67, smalltalk80)
path(L, L)
path(L,M) :- link(L,X), path(X,M)
```

## In Prolog

---

- ◆ A simple term is a number, variable or an atom that stands for itself
  - ▶ All variables start with capital letters
  - ▶ All constants are in lower case
- ◆ A compound term consists of an atom followed by a parenthesized sequence of subterms.
  - ▶ The atom is called a functor
  - ▶ Subterms are called arguments
  - ▶ All predicates are in lower case

## Horn Clauses with Variables

---

- ◆ Variables may appear in the antecedents and the consequent of a Horn clause:

- ▶  $p(X_1, X_2, \dots, X_n) \text{ :- } h(X_1, X_2, \dots, X_m)$

- ▶  $p(X_1, X_2, \dots, X_n) \text{ :- } h(X_1, X_2, \dots, X_m, Y_1, Y_2, \dots, Y_k)$

## Queries

---

- ◆ Simplest form: Does a particular tuple belong to a relation
  - ▶ `path(algol60, smalltalk80).`
- ◆ Can't ask: Does a particular tuple not belong to a relation
  - ▶ Yes/Fail rather than Yes/No answers, where Fail indicates a failure to deduce an answer.
- ◆ More interesting: Is there an X such that a specific clause containing X evaluates to yes
  - ▶ `path(X, cplusplus)`

## Examples

---

```
1 ?- consult(myrules).  
myrules compiled, 0.00 sec, 1,640 bytes.  
Yes  
2 ?- path(X,cplusplus).  
X = cplusplus ;  
X = fortran ;  
X = fortran ;  
X = algol60 ;  
X = cpl ;  
X = bcpl ;  
X = c ;  
X = algol60 ;  
X = simula67 ;  
No  
3 ?- path(c,Y).  
Y = c ;  
Y = cplusplus ;  
No  
4 ?- path(algol60,smalltalk80).  
Yes
```

## More Examples

---

```
?- link(N,M), link(L,M).  
N = fortran  
M = algol60  
L = fortran  
Yes  
?- link(N,M), link(L,M), not(L=N).  
N = c  
M = cplusplus  
L = simula67  
Yes
```
