Abstract

Lie symmetry method is applied to analyse Fisher equation in cylindrical coordinates. Symmetry algebra is found and symmetry invariance is used to reduce the equation to a first-order ODE. The first-order ODE is further analysed to obtain exact solution of Fisher equation in explicit form.

The Lie symmetry approach to study a non-linear partial differential equation is based on finding its symmetry algebra which leads to reductions and construction of exact solutions of the PDE under investigation. Symmetry solutions of Fisher equation [6]

\[
\frac{\partial u}{\partial t} - \frac{\partial^2 u}{\partial x^2} = u(1 - u),
\]

which arises in Heat Transfer, Biology & Ecology, have been investigated in [1,3,5]. It is well known for heat equation models that, in general, the thermal properties of the medium are not constant and may depend upon the temperature [7]. This leads to the following generalization:

\[
\frac{\partial u}{\partial t} - \frac{\partial}{\partial x} \left( u \frac{\partial u}{\partial x} \right) = u(1 - u). \tag{1}
\]

If \( \nabla \) denotes the gradient operator then, in higher dimensions, this equation takes the form

\[
\frac{\partial u}{\partial t} - \nabla \cdot \left( u \nabla u \right) = u(1 - u), \tag{2}
\]

where complete symmetry analysis of this equation needs to be carried out. Here, we investigate Eq. (2) in case of cylindrical domains with \( u \) depending only on radius. If the radial variable is denoted by \( x \) then the corresponding
