Q4: find the limit if it exists

$$1. \lim_{x \rightarrow 1} \frac{\sqrt{x^2+1}-\sqrt{2}}{x-1} =$$

$$\lim_{x \rightarrow 1} \frac{\sqrt{x^2+1}-\sqrt{2}}{x-1} = \lim_{x \rightarrow 1} \left(\frac{\sqrt{x^2+1}-\sqrt{2}}{x-1} \right) \left(\frac{\sqrt{x^2+1}+\sqrt{2}}{\sqrt{x^2+1}+\sqrt{2}} \right) \quad 1\text{pt.}$$

$$= \lim_{x \rightarrow 1} \frac{x^2+1-2}{(x-1)\sqrt{x^2+1}+\sqrt{2}} = \lim_{x \rightarrow 1} \frac{(x-1)(x+1)}{(x-1)\sqrt{x^2+1}+\sqrt{2}} \quad 1\text{pt.}$$

$$= \lim_{x \rightarrow 1} \frac{(x+1)}{\sqrt{x^2+1}+\sqrt{2}} = \frac{2}{2\sqrt{2}} = \frac{1}{\sqrt{2}} \quad 2\text{pts.}$$

$$2. \lim_{x \rightarrow -1} \frac{x+1}{(2x^2+7x+5)^2} =$$

$$\lim_{x \rightarrow -1} \frac{x+1}{(2x^2+7x+5)^2} = \lim_{x \rightarrow -1} \frac{x+1}{((2x+5)(x+1))^2} \quad 1\text{pt.}$$

$$= \lim_{x \rightarrow -1} \frac{1}{(x+1)(2x+5)^2} = DNE \quad 1\text{pt.}$$

$$\text{Because } \lim_{x \rightarrow -1^-} \frac{1}{(x+1)(2x+5)^2} = -\infty \quad \text{and} \quad \lim_{x \rightarrow -1^+} \frac{1}{(x+1)(2x+5)^2} = +\infty \quad 2\text{pts.}$$

$$3. \lim_{x \rightarrow -\infty} \frac{5x^5+1}{|x|^5-4} =$$

$$\lim_{x \rightarrow -\infty} \frac{5x^5+1}{|x|^5-4} = \lim_{x \rightarrow -\infty} \frac{5x^5+1}{-x^5-4} \quad 1\text{pt.}$$

$$= \lim_{x \rightarrow -\infty} \frac{5+\frac{1}{x^5}}{-1-\frac{4}{x^5}} = \frac{5-0}{-1-0} = -5 \quad 1\text{pt.}$$

Q2: Prove that $\lim_{x \rightarrow -1} (2 - 3x) = 5$ using the $\varepsilon - \delta$ definition

Solution

Let Given $\varepsilon > 0$ we need to find $\delta > 0$ such that if
 $|f(x) - 5| < \varepsilon$ whenever $0 < |x - (-1)| < \delta$

$$|2 - 3x - 5| < \varepsilon \text{ whenever } 0 < |x + 1| < \delta \quad 1\text{pt.}$$

$$|-3 - 3x| < \varepsilon \text{ whenever } 0 < |x + 1| < \delta \quad 1\text{pt.}$$

$$|(-3)(x + 1)| < \varepsilon \text{ whenever } 0 < |x + 1| < \delta$$

$$3|x + 1| < \varepsilon \text{ whenever } 0 < |x + 1| < \delta \quad 1\text{pt.}$$

$$|x + 1| < \frac{\varepsilon}{3} \text{ whenever } 0 < |x + 1| < \delta \quad 1\text{pt.}$$

$$\text{If we choose } \delta = \frac{\varepsilon}{3} \text{ then } 0 < |x + 1| < \delta = \frac{\varepsilon}{3} \text{ that is } |f(x) - 5| < \varepsilon \quad 1\text{pt.}$$

Q3: Let $f(x) = x^2 - 4x$ be a function defined over the interval $[-1, 2]$, use the limit to find the equation of the tangent line at $P(1, -3)$.

To find the slope of the tangent line

$$m = \lim_{h \rightarrow 0} \frac{f(a+h) - f(a)}{h} = \lim_{h \rightarrow 0} \frac{(a+h)^2 - 4(a+h) - a^2 + 4a}{h} \quad 1\text{pt.}$$

$$= \lim_{h \rightarrow 0} \frac{a^2 + 2ah + h^2 - 4a - 4h - a^2 + 4a}{h}$$

$$= \lim_{h \rightarrow 0} \frac{2ah + h^2 - 4h}{h} = \lim_{h \rightarrow 0} \frac{h(2a + h - 4)}{h} \quad 1\text{pt.}$$

$$= \lim_{h \rightarrow 0} 2a + h - 4 = 2a - 4 \quad 1\text{pt.}$$

The slope of the tangent line at $a = 1$ is equal to $m = -2$ 1pt.

Thus the equation of the tangent line $y + 3 = -2(x - 1)$ 1pt.

Q4: Find the horizontal and the vertical asymptotes of $f(x) = \frac{1+4e^x}{1-2e^x}$

Solution:

1. To find the H.A, we must evaluate the limits at infinity

$$\lim_{x \rightarrow \infty} \frac{1+4e^x}{1-2e^x} = \lim_{x \rightarrow \infty} \frac{\frac{1}{e^x}+4}{\frac{1}{e^x}-2} = \frac{0+4}{0-2} = -2$$

1pt.

and

$$\lim_{x \rightarrow -\infty} \frac{1+2e^x}{1-e^x} = \frac{1+0}{1-0} = 1$$

1pt.

$y = 1$ & $y = -2$ are H.A

½ pt.

2. To find the V.A, we need to find the limit when the denominator equal to 0

$$1 - 2e^x = 0 \quad \text{1pt.} \quad \rightarrow \quad e^x = \frac{1}{2} \quad \rightarrow \quad x = \ln \frac{1}{2} \quad \text{1pt.}$$

$$x = \ln \frac{1}{2} \quad \text{V.A} \quad \text{½ pt.}$$
