Q1: A group dental policy has a negative binomial claim count distribution with mean 300 and variance 800.

Ground-up severity is given by the following table:

| Severity | Probability |
|----------|-------------|
| 40 | 0.25 |
| 80 | 0.25 |
| 120 | 0.25 |
| 200 | 0.25 |

You expect severity to increase 50% with no change in frequency. You decide to impose a per claim deductible of 100.

Calculate the expected total claim payment after these changes.

Answer: 22,500

Q2: Michael is a professional stuntman who performs dangerous motorcycle jumps at extreme sports events around the world.

The annual cost of repairs to his motorcycle is modeled by a two parameter Pareto distribution with $\theta = 5000$ and $\alpha = 2$.

An insurance reimburses Michael's motorcycle repair costs subject to the following provisions:

(i) Michael pays an annual ordinary deductible of 1000 each year.

(ii) Michael pays 20% of repair costs between 1000 and 6000 each year.

(iii) Michael pays 100% of the annual repair costs above 6000 until Michael

Has paid 10,000 in out-of-pocket repair costs each year.

(iv)Michael pays 10% of the remaining repair costs each year.

Calculate the expected annual insurance reimbursement.

Q3: For a special investment product, you are given:

(i) All deposits are credited with 75% of the annual equity index return, subject to a minimum guaranteed crediting rate of 3%.

(ii) The annual equity index return is normally distributed with a mean of 8% and a standard deviation of 16%.

(iii) For a random variable X which has a normal distribution with mean μ and standard deviation σ , you are given the following limited expected values:

| E(X ^ 3%) | | | | |
|-----------|--------|--------|--|--|
| | μ=6% | μ=8% | | |
| σ=12% | -0.43% | 0.31% | | |
| σ=16% | -1.99% | -1.19% | | |

| E(X ^ 4%) | | | | |
|-----------|--------|--------|--|--|
| | μ=6% | μ=8% | | |
| σ=12% | 0.15% | 0.95% | | |
| σ=16% | -1.43% | -0.58% | | |

Calculate the expected annual crediting rate.
