Four point masses are at the corners of a square whose side is 20 cm long (see figure 4). What is the magnitude of the net gravitational force on a point mass $m_5 = 2.5$ kg located at the center of the square?

$$F_{\text{net}} = G \frac{m_s (4 \frac{19}{9})}{(0.1414)^2} = \frac{6.67 \times 16^{11} (2.5)(4)}{(0.1414)^2}$$
$$= 3.3 \times 16^{-8} \text{ N}$$

A planet has a mass of 5.0×10^{23} kg and a radius of 2.0×10^6 m. A rocket is fired vertically from the surface of the planet with an initial speed of 4.0 km/s. What is the speed of the rocket when it is 1.0×10^6 m from the surface of the planet?
