

**CE 203 STRUCTURAL MECHANICS I**

Second Semester 1433 / 2012 (112)

**HOMEWORK NO. 5**

- **Textbook Sections Covered:** 4.4- 4.7
- **Subject Material Covered:** Axially Loaded members: Statically Indeterminate & Thermal Stresses; Stress Concentration
- **DUE DATE: Monday 12-4-1433 (5-3-2012)**

- 1) Determine the stresses in members AB ( $A = 80 \text{ mm}^2$ ,  $E = 70 \text{ GPa}$ ) and CD ( $A = 30 \text{ mm}^2$ ,  $E = 210 \text{ GPa}$ ) shown in Fig. P1. [Secs. 4.4 & 4.5] (20 pts.)
- 2) In Fig. P2 shown, determine the stresses in BF and DG and the force in the spring if
  - a-  $\delta = 0$
  - b-  $\delta = 0.5 \text{ mm}$  (before applying the load)
  - c-  $\delta = 1.5 \text{ mm}$  (before applying the load)[Secs. 4.4 & 4.5] (30 pts.)
- 3) A 12-mm-diameter steel rod, shown in Fig. P3, is welded to a rigid plate that is supported by a brass pipe whose outside diameter is 30 mm and whose inside diameter is 20 mm. The temperature is increased by  $50^\circ \text{ C}$  in the steel and decreased by  $40^\circ \text{ C}$  in the brass. If  $E_{ST} = 210 \text{ GPa}$ ,  $\alpha_{ST} = 12 (10)^{-6} / ^\circ \text{ C}$ , and  $E_{BR} = 105 \text{ GPa}$ ,  $\alpha_{BR} = 18 (10)^{-6} / ^\circ \text{ C}$ , determine
  - a- the displacement of point A;
  - b- the stress in the steel and in the brass.[Sec. 4.6] (10 pts.)
- 4) Solve problem 4-78 (p. 156) in the textbook, but for  $CB$  let  $L = 0.4 \text{ m}$  (instead of 0.5),  $D = 60 \text{ mm}$  (instead of 50), and the material be red brass (instead of steel). Solve the problem by
  - a- applying the load, then the temperature,
  - b- applying the temperature, then the load,
  - c- applying the load and temperature simultaneously.What conclusion can you make? Which method do you like? Why? [Sec. 4.6] (25 pts.)
- 5) Determine the maximum allowable force  $P$  that can be applied on the plate (thickness = 10 mm) shown in Fig. P5 if the failure tensile stress is 150 MPa, and a factor of safety of 1.5 is needed. [Secs. 4.7] (15 pts.)
