## Magnitude Comparator

In this lesson you will learn about
1.Magnitude comparator
2.How to design a 4-bit comparator

## Definition

A magnitude comparator is a combinational circuit that compares two numbers A \& B to determine whether:

$$
\begin{aligned}
& >A>B, \text { or } \\
& >A=B \text {, or } \\
& >A<B
\end{aligned}
$$

Inputs
First $n$-bit number A
Second $n$-bit number B
Outputs
3 output signals (GT, EQ, LT), where:

1. $\mathrm{GT}=1 \quad \mathrm{IFF} \mathrm{A}>\mathrm{B}$
2. $\mathrm{EQ}=1 \quad \mathrm{IFF} \mathrm{A}=\mathrm{B}$
3. $\mathrm{LT}=1 \quad \mathrm{IFF} \mathrm{A}<\mathrm{B}$

Note: Exactly One of these 3 outputs equals 1 , while the other 2 outputs are 0 's

4-bit magnitude comparator
Inputs: 8 -bits ( $A \Rightarrow 4$-bits, $B \Rightarrow 4$-bits)
A and B are two 4-bit numbers
$>\operatorname{Let} \mathrm{A}=\mathrm{A}_{3} \mathrm{~A}_{2} \mathrm{~A}_{1} \mathrm{~A}_{0}$, and
$>$ Let $\mathrm{B}=\mathrm{B}_{3} \mathrm{~B}_{2} \mathrm{~B}_{1} \mathrm{~B}_{0}$
$>$ Inputs have $2^{8}(250)$ possible combinations
$>$ Not easy to design using conventional techniques

The circuit possesses certain amount of regularity $\Rightarrow$ can be designed algorithmically.
Design of the EQ output $(\mathrm{A}=\mathrm{B})$ in 4-bit magnitude comparator Define $\mathrm{X}_{i}=\left(\mathrm{A}_{i} \mathrm{~B}_{i}\right)+\left(\mathrm{A}_{i}{ }^{\dagger} \mathrm{B}_{i}{ }^{\prime}\right)$

Thus $\quad \mathrm{X}_{i}=1$ IFF $\mathrm{A}_{i}=\mathrm{B}_{i} \quad \forall i=0,1,2$ and 3

$$
\mathrm{X}_{i}=0 \operatorname{IFF} \mathrm{~A}_{i} \neq \mathrm{B}_{i}
$$

Condition for $\mathrm{A}=\mathrm{B}$
$E Q=1$ (i.e., $A=B$ ) IFF

1. $\mathrm{A}_{3}=\mathrm{B}_{3} \rightarrow\left(\mathrm{X}_{3}=1\right)$, and
2. $\mathrm{A}_{2}=\mathrm{B}_{2} \rightarrow\left(\mathrm{X}_{2}=1\right)$, and
3. $\mathrm{A}_{1}=\mathrm{B}_{1} \rightarrow\left(\mathrm{X}_{l}=1\right)$, and
4. $\mathrm{A}_{0}=\mathrm{B}_{0} \rightarrow\left(\mathrm{X}_{0}=1\right)$.

Thus, $E Q=1$ IFF $X_{3} X_{2} X_{1} X_{0}=1$. In other words, $E Q=X_{3} X_{2} X_{1} X_{0}$
Design of the GT output ( $\mathrm{A}>\mathrm{B}$ ) 4-bit magnitude comparator
If $A_{3}>B_{3}$, then $A>B(G T=1)$ irrespective of the relative values of the other bits of $A$ \&
B. Consider, for example, $\mathrm{A}=1000$ and $\mathrm{B}=0111$ where $\mathrm{A}>\mathrm{B}$.

This can be stated as GT=1 if $\mathbf{A}_{\mathbf{3}} \mathbf{B}_{\mathbf{3}}{ }^{\prime}=\mathbf{1}$
If $A_{3}=B_{3}\left(X_{3}=1\right)$, we compare the next significant pair of bits $\left(A_{2} \& B_{2}\right)$.
If $A_{2}>B_{2}$ then $A>B(G T=1)$ irrespective of the relative values of the other bits of $A \&$ B. Consider, for example, $\mathrm{A}=0100$ and $\mathrm{B}=0011$ where $\mathrm{A}>\mathrm{B}$.

This can be stated as GT=1 if $\mathbf{X}_{\mathbf{3}} \mathbf{A}_{\mathbf{2}} \mathbf{B}_{\mathbf{2}}{ }^{\prime}=\mathbf{1}$
If $\left.A_{3}=\underline{B}_{3} \underline{X}_{\underline{3}}=1\right)$ and $A_{2}=\underline{B}_{2}\left(X_{2}=1\right)$, we compare the next significant pair of bits $\left(A_{1}\right.$ \& $\mathrm{B}_{1}$ ).

If $A_{1}>B_{1}$ then $A>B(G T=1)$ irrespective of the relative values of the remaining bits $A_{0}$ \& $\mathrm{B}_{0}$. Consider, for example, $\mathrm{A}=0010$ and $\mathrm{B}=0001$ where $\mathrm{A}>\mathrm{B}$
This can be stated as GT=1 if $\mathbf{X}_{\mathbf{3}} \mathbf{X}_{\mathbf{2}} \mathbf{A}_{\mathbf{1}} \mathbf{B}_{\mathbf{1}}{ }^{\prime}=\mathbf{1}$
If $\mathrm{A}_{3}=\mathrm{B}_{3}\left(X_{3}=1\right)$ and $\mathrm{A}_{2}=\underline{B}_{2}\left(X_{2}=1\right)$ and $\mathrm{A}_{1}=\mathrm{B}_{1}\left(X_{1}=1\right)$, we compare the next pair of bits $\left(\mathrm{A}_{0} \& \mathrm{~B}_{0}\right)$.
If $A_{0}>B_{0}$ then $A>B(G T=1)$. This can be stated as $G T=1$ if $\mathbf{X}_{\mathbf{3}} \mathbf{X}_{\mathbf{2}} \mathbf{X}_{\mathbf{1}} \mathbf{A}_{\mathbf{0}} \mathbf{B}_{\mathbf{0}}{ }^{\prime}=\mathbf{1}$
To summarize, $\mathrm{GT}=1(\mathrm{~A}>\mathrm{B})$ IFF:

1. $\mathbf{A}_{3} \mathbf{B}_{3}{ }^{\prime}=\mathbf{1}$, or
2. $\mathbf{X}_{3} \mathbf{A}_{2} \mathbf{B}_{2}{ }^{\prime}=\mathbf{1}$, or
3. $\mathbf{X}_{\mathbf{3}} \mathbf{X}_{\mathbf{2}} \mathbf{A}_{\mathbf{1}} \mathbf{B}_{\mathbf{1}}{ }^{\prime}=\mathbf{1}$, or
4. $\mathbf{X}_{3} \mathbf{X}_{2} \mathbf{X}_{1} \mathbf{A}_{0} \mathbf{B}_{\mathbf{0}}{ }^{\prime}=\mathbf{1}$

In other words, $\mathbf{G T}=\mathbf{A}_{\mathbf{3}} \mathbf{B}_{\mathbf{3}}{ }^{\prime}+\mathbf{X}_{\mathbf{3}} \mathbf{A}_{\mathbf{2}} \mathbf{B}_{\mathbf{2}}{ }^{\prime}+\mathbf{X}_{\mathbf{3}} \mathbf{X}_{\mathbf{2}} \mathbf{A}_{\mathbf{1}} \mathbf{B}_{\mathbf{1}}{ }^{\prime}+\mathbf{X}_{\mathbf{3}} \mathbf{X}_{\mathbf{2}} \mathbf{X}_{\mathbf{1}} \mathbf{A}_{\mathbf{0}} \mathbf{B}_{\mathbf{0}}{ }^{\prime}$
Design of the LT output $(\mathrm{A}<\mathrm{B})$ 4-bit magnitude comparator
In the same manner as above, we can derive the expression of the LT $(\mathrm{A}<\mathrm{B})$ output $\mathbf{L T}=\mathbf{B}_{3} \mathbf{A}_{\mathbf{3}}{ }^{\prime}+\mathbf{X}_{3} \mathbf{B}_{\mathbf{2}} \mathbf{A}_{\mathbf{2}}{ }^{\prime}+\mathbf{X}_{\mathbf{3}} \mathbf{X}_{2} \mathbf{B}_{\mathbf{1}} \mathbf{A}_{\mathbf{1}}{ }^{\prime}+\mathbf{X}_{\mathbf{3}} \mathbf{X}_{2} \mathbf{X}_{1} \mathbf{B}_{0} \mathbf{A}_{\mathbf{0}}{ }^{\prime}$ The gate implementation of the three output variables (EQ, GT \& LT) is shown in the figure below.

## Modification to the Design

The hardware in the comparator can be reduced by implementing only two outputs, and the third output can be obtained using these two outputs.
For example, if we have the LT and GT outputs, then the EQ output can be obtained by using only a NOR gate, as shown in the figure below.

Thus, when both the GT and LT outputs are zeros, then the $3^{\text {rd }}$ one (i.e. EQ) is a ' 1 '
