Consider the 5-bus power network shown bellow,

5-bus network, all impedances are in per unit

Use the Chained Data Structure Method (row fashion approach; STO, IC, NX, and NFIRST) for storing and modifying the following:

- Bus admittance matrix referenced to bus "0" using the building algorithm.
- Bus impedance matrix referenced to bus "0" using the building algorithm.
- Check if multiplication of the bus admittance matrix and bus impedance matrix result into the identity matrix.
- Consider the addition of a new line between buses 3 and 5 with line impedance of $j0.5$ per-unit. Modify the bus admittance matrix only.
- Consider the modification of part (d), remove bus 4. Modify the bus admittance matrix only.
