Electrical Engineering Department
EE-390; Exam-2(071); 6 ${ }^{\text {th }}$ January, 2008

| Prob.1 | Prob.2 | Prob.3 | Total |
| :--- | :--- | :--- | :--- |
|  |  |  |  |

| Name: | Section: | I.D. |
| :--- | :--- | :--- |

Answer all three questions, which carries equal marks. Exam TIME: 6:30 to 8:00 PM
1(a). Find the address of Port A and Port C of $0^{\text {th }}$ PPI. Show how you obtain your answers and write them in the specified box below. Assume don't care address pins are at 'logic 0 ' state.

| Port A (Physical address) | (in Hex) |
| :--- | :--- |
| Port C (Physical address) | (in Hex) |

## **Remember to use 0's for don't cares address pins.

1(b). As shown in the previous figure, the data pins ( $\mathrm{D}_{0}-\mathrm{D}_{7}$ ) of the scanner are connected with the $\mathrm{PA}_{0}-\mathrm{PA}_{7}$ (port A) of the $0^{\text {th }} \mathrm{PPI}$ and the strobe signal $(\overline{\mathrm{STB}})$ of the scanner is connected with the LSB of Port C, of the $0^{\text {th }}$ PPI.

Assume that once a byte-data is scanned, the scanner generates a short strobepulse (' 1 ' $\rightarrow$ ' 0 ' $\rightarrow$ ' 1 '), during which the computer receives the scanned databyte. (Thus, during 'logic 0 ' state of $\overline{S T B}$ signal, $P A_{0}-P A_{7}$ of the $0^{\text {th }} P P I$ receives the scanned data-byte but during 'logic 1' state, $P A_{0}-P A_{7}$ of the $0^{\text {th }}$ PPI do not receive any data from the scanner)

Write an efficient assembly language program, which will use Isolate I/O interface to operate the PPI in MODE 0 and store eleven scanned data bytes in memory location starting from physical address DS:000 $\mathrm{A}_{\mathrm{H}}$. The unused ports of the PPI should behave like output ports.

                MOV AX,SP
                SAHF
                RET
        ENDP
END
```

After the program execution, find:

BX = $\qquad$ ;

SP = $\qquad$ ;

Carry Flag = $\qquad$ ;

## 2(b). Answer the following questions in the given space below:

(i) Write a program (sequence of instructions) that will load the offset address of '4321 ${ }_{\mathrm{H}}$ ' into Instruction Pointer (IP).
(ii) When the 8086's $\mathrm{A}_{0}$ and $\overline{\mathrm{BHE}}$ pins are both at 'logic high' state, CPU access;
(a) Even addressed Word
(b) Odd addressed Word;
(Encircle the correct answer/answers)
(c) None of the above ;

3(a). Write the approximate steps needed to complete an Input/output Read Bus-cycle for a 8088 CPU, operating in Minimum-Mode.
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

3(b). For a minimum mode Write Bus-cycle, pin 28 of the CPU is sending a signal of
' $\mathrm{M} / \overline{\mathrm{IO}}$ ' = 'logic 1 '. What type of CPU is used here (8088/8086): $\qquad$ .

3(c). If SI=1234 ${ }_{\mathrm{H}}$ and $\mathrm{DI}=9876_{\mathrm{H}}$, Write a program using 'REP' prefix' and 'String Handling Instruction', which will move 3 data-bytes starting from a physical address DS:SI to ES:DI. (Use the given lines for the program.)
