

An infinitely long cylinder, of radius  $R$ , carries a "frozen-in" magnetization parallel to the axis,

$$\mathbf{M} = ks^2\hat{\mathbf{z}}$$

where  $k$  is a constant and  $s$  is the distance from the axis; there is no free current anywhere.

- Find the magnetic field inside and outside the cylinder by two different methods:
  - 1- Locate all the bound currents, and then calculate the field they produce.
  - 2- Use Ampere's law  $\oint \mathbf{H} \cdot d\mathbf{l} = I_{enc}$  to find  $\mathbf{H}$ , and then get  $\mathbf{B}$ .
- Sketch  $\mathbf{H}$ ,  $\mathbf{M}$  and  $B/\mu_0$  as a function of  $s$ . Let  $k = 1$ .
