

**King Fahd University of
Petroleum & Minerals
Computer Engineering Dept**

**COE 341 – Data and Computer
Communications**

Term 082

Dr. Ashraf S. Hasan Mahmoud

Rm 22-148-3

Ext. 1724

Email: ashraf@kfupm.edu.sa

2/28/2009

Dr. Ashraf S. Hasan Mahmoud

1

Lecture Contents

1. Protocols
 - a. Characteristics
 - b. Functions
2. OSI
 - a. The model
 - b. OSI layers
3. TCP/IP Protocol Suite

2/28/2009

Dr. Ashraf S. Hasan Mahmoud

2

Protocols - Definition

- **What is a Protocol:**
 - **Convention between two communicating entities governing exchange of data**
- **Elements of Protocol:**
 - **Syntax: data format, signal levels, etc.**
 - **Semantics: control info coordination and error handling**
 - **Timing: matching speeds and sequencing (synchronization)**

2/28/2009

Dr. Ashraf S. Hasan Mahmoud

3

Standards Organizations

- **Internet Society (<http://www.isoc.org/>):**
 - **Internet Organization and RFC Publication**
 - **Internet Architecture Board (IAB)**
 - **Internet Engineering Task Force (IETF)**
 - **Internet Engineering Steering Group (IESG)**
- **International Organization for Standardization or ISO:**
 - **Open System Interface (OSI): communication architecture and reference model**

2/28/2009

Dr. Ashraf S. Hasan Mahmoud

4

Standards Organizations

- **International Telecommunication Union (ITU)**
 - United nations organization
 - ITU-T: Telecommunications Standardization Sector
 - Replaced International Telegraph and Telephone Consultative Committee (CCITT)
- **ATM Forum:**
 - 600 member companies

2/28/2009

Dr. Ashraf S. Hasan Mahmoud

5

Protocols - Characteristics

- **Characteristics:**
 - **Direct/Indirect:**
 - Direct: e.g for point-to-point communications, RS-232
 - Indirect: e.g devices connected through other nodes (internetwork, internet)
 - **Monolithic/Structured**
 - Monolithic: One package (SW and HW) performing all functions pertaining to the comm session
 - Structured: modular approach ← The focus of this course

2/28/2009

Dr. Ashraf S. Hasan Mahmoud

6

Protocols - Characteristics

- **Characteristics – cont'd:**
 - **Symmetric/Asymmetric**
 - **Symmetric:** comm between peer entities
 - **Asymmetric:** to keep one side simple
 - E.g. client-server model, polling methods
 - **Standard/Nonstandard**
 - **Standard:** conforming to a single agreed upon standard
 - **Nonstandard:** no conformity
 - **Clients vs. vendors ?**

2/28/2009

Dr. Ashraf S. Hasan Mahmoud

7

Protocols - Functions

- **Encapsulation**
- **Segmentation and Assembly**
- **Connection Control**
- **Ordered Delivery**
- **Flow Control**
- **Error Control**
- **Addressing**
- **Multiplexing**
- **Transmission Services**

2/28/2009

Dr. Ashraf S. Hasan Mahmoud

8

Protocols - Functions

- **Encapsulation:**
 - **PDU: block of data exchanged between two entities**
 - **PDU = user data + overhead (addressing, error control, protocol control)**
 - **User data is referred to as SDU**
- **Segmentation and Reassembly:**
 - **Example: ATM (53 bytes cells) core with Ethernet LAN (frames up to 1526 bytes)**

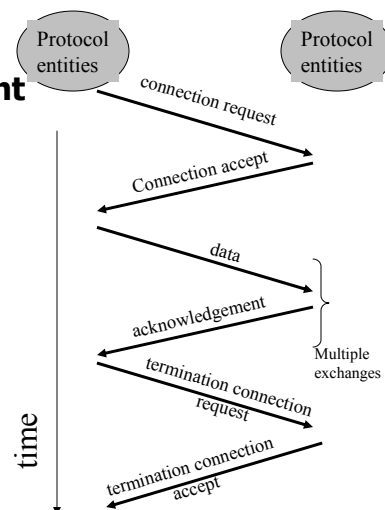

2/28/2009

Dr. Ashraf S. Hasan Mahmoud

9

Protocols - Functions

- **Connection Control:**
 - **Connection establishment**
 - **Data transfer**
 - **Connection termination**

2/28/2009

Dr. Ashraf S. Hasan Mahmoud

10

Protocols - Functions

- **Ordered Delivery**
 - **Ordered delivery of PDUs**
 - **Requires buffering, sequence numbers**
- **Flow control:**
 - **Limit amount of flow – e.g stop and wait procedure – receiving entity must acknowledge block before transmitter sends the next one in line**

Protocols - Functions

- **Error Control**
 - **To combat corruption of transmitted data**
 - **Transmitters inserts overhead info to detect corruption**
 - **Receiver checks overhead bits and finds out if block is corrupted or not**
 - **Corrupted – may be correctable or request another copy**
 - **OK – accept block**

Protocols - Functions

- **Addressing:**
 - **Level, Scope, Connection Identifiers, and Mode**

Level:

- Process or application address (e.g. SAP)
- Network level address (e.g. IP)

Scope:

- IP is globally unique and applicable
- Network attachment point address (e.g. MAC frames, X.25)

CI:

- Connection vs. connectionless
- Connection: use connection name (e.g. virtual circuit identifier)
- Connectionless: with each transmission the global address is used

Mode:

- Unicast
- Multicast
- Broadcast

2/28/2009

Dr. Ashraf S. Hasan Mahmoud

13

Protocols - Functions

- **Multiplexing:**
 - **Multiple virtual circuits on one physical link (e.g X.25 – from one end system to another)**
 - **Mapping connections from one level (layer) to another:**
 - **E.g. Multiple service points carried on one virtual circuit (called upward or inward multiplexing)**
 - **Downward multiplexing: one high level connection is split or served by multiple lower level connections (for reliability and performance issues)**

2/28/2009

Dr. Ashraf S. Hasan Mahmoud

14

The OSI Model

- Software model and abstraction
- Defines set of layers and the services at these layers necessary to perform communication
- Promotes compatibility of network designs
- Logical partitioning:
 - Manageability and scalability

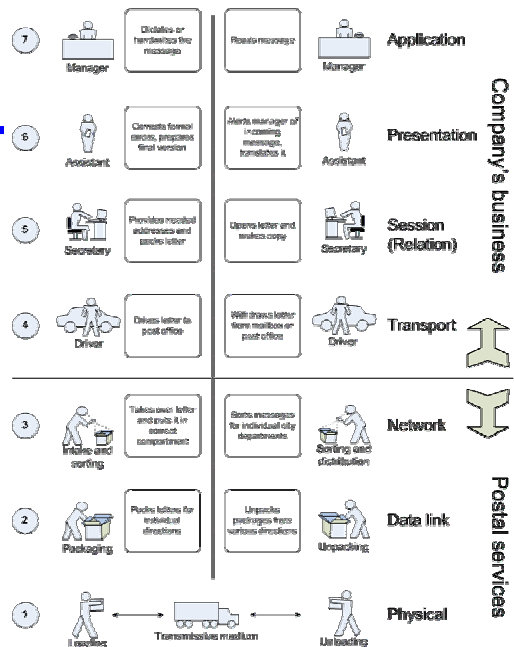

2/28/2009

Dr. Ashraf S. Hasan Mahmoud

15

The OSI Model – Example:

- Source: http://en.wikipedia.org/wiki/OSI_model

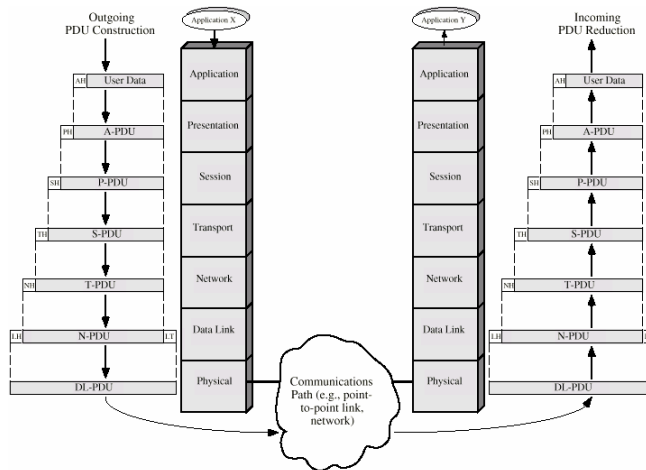

2/28/2009

Dr. Ashraf

RM – OSI and letter communication parallel

The OSI Model - Environment

- Layer *i* establishes a PEER relationship with layer *i* on the target node
- This means Layer *i* requires service from layer *i*-1
- And so on
- The use of the PDUs
- No direct communication except for the physical layer – all other communication is indirect or virtual
- Encapsulation of user data
- Each layer may segment SDU to accommodate its own requirement – These are reassembled at the other end

2/28/2009

Dr. Ashraf S. Hasan Mahmoud

17

The OSI Model - Framework

- Very similar to subroutine or function design in software engineering
- Boundaries and functionalities are well designed – development of one layer has little or no effect on other layers
- Protocol specification:
 - Format of PDUs, and the semantic of each field
- Service definition:
 - What are the services provided to upper layer and the lower one
- Addressing:
 - E.g: NSAP is the address of an entity in the transport layer who uses the network service

2/28/2009

Dr. Ashraf S. Hasan Mahmoud

18

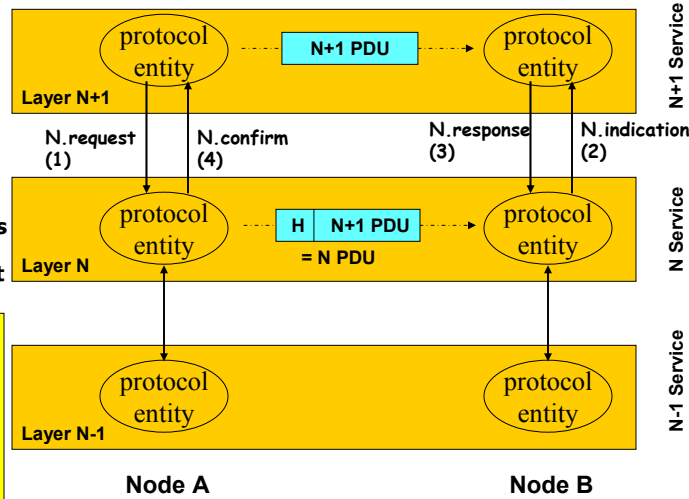

The OSI Model - Framework

- **Service Primitives:**

- Request:
- Indication:
- Respond
- Confirm

- **Note:**

- Encapsulation
- Peer communication is virtual (dashed lines) – except at physical layer
- Figure shows confirmed services case – For non confirmed services, the initiator receives no confirmation.

2/28/2009

Dr. Ashraf S. Hasan Mahmoud

19

The OSI Model – Physical Layer

- **Specifications:**

- **Mechanical:** dimensions, connectors, etc.
- **Electrical:** signal levels, rates of change, etc
- **Functional:** functions performed by each circuit
- **Procedural:** steps required to transport bits from one end to the other
- **Provides service to do “transmission of raw bits”**

2/28/2009

Dr. Ashraf S. Hasan Mahmoud

20

The OSI Model – Data Link Layer

- **Converts the raw bit stream service provided by the physical layer to a reliable stream:**
 - Performs error detection and error control
- **Examples: HDLC, LAPB, LLC, etc**

2/28/2009

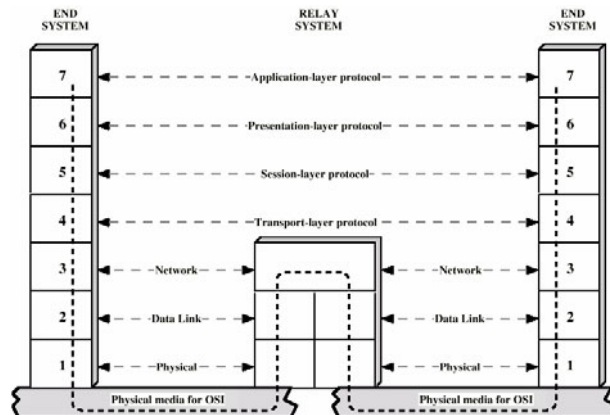

Dr. Ashraf S. Hasan Mahmoud

21

The OSI Model – Network Layer

- **Service: transfer of information between two end systems across communication network – End to end delivery of packets**

- **Two end systems may be connected by:**
 - **Point-2-point: no need for network layer**
 - **Same network (see figure)**
 - **Different network**

2/28/2009

The OSI Model – Transport Layer

- **Service: mechanism of exchanging data (or messages) between the two end systems:**
 - For connection oriented networks:
 - Error-free delivery
 - Ordered delivery
 - No loss or duplication
 - Attempts to provide a certain quality of service (QoS) {certain max error rate, delay jitter, etc) through optimizing the the network layer services
- **Example: TCP (connection oriented), UDP (connectionless)**

2/28/2009

Dr. Ashraf S. Hasan Mahmoud

23

The OSI Model – Session Layer

- **Service: mechanism of controlling the dialogue between applications at end systems**
 - Dialogue Discipline
 - Grouping
 - Recovery

2/28/2009

Dr. Ashraf S. Hasan Mahmoud

24

The OSI Model – Presentation

- **Service: defines format of data (format, encryption, and compression) to be exchanged between applications**

The OSI Model – Application

- **Service: A means for user applications (email, ftp, etc) to access the services provided by the OSI model**

The TCP/IP Model

- **TCP/IP is the result of R&D conducted on experimental packet switched network (ARPANET) and funded by Defense Advanced Research Agency (DARPA)**
- **TCP/IP is NOW the dominant commercial architecture – The foundation of the internet and its applications**

2/28/2009

Dr. Ashraf S. Hasan Mahmoud

27

The TCP/IP Model

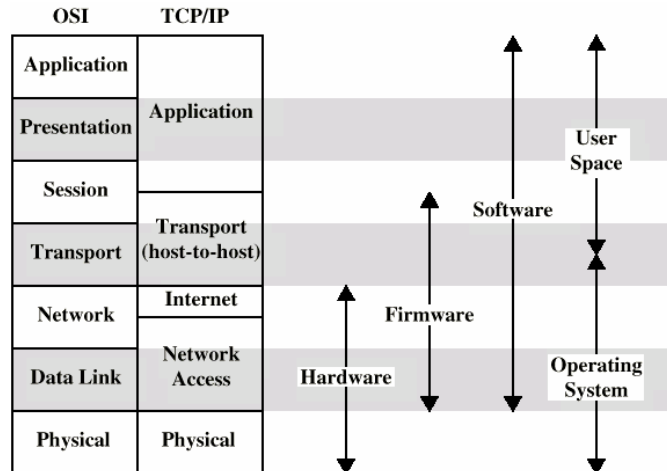

- **Model has five independent layers:**
 - **Application layer: comm between processes or applications on separate hosts**
 - **Transport layer: end-2-end transfer service – may include reliability mechanisms**
 - **Internet layer: routing data from source to destination through one or more networks**
 - **Network access layer: logical interface between end systems and the network**
 - **Physical layer: defines mechanism of transmitting raw bits depending on media characteristic**

2/28/2009

Dr. Ashraf S. Hasan Mahmoud

28

The TCP/IP Model (using the OSI Model as a reference)

2/28/2009

Dr. Ashraf S. Hasan Mahmoud

29

Example of TCP/IP Communications

- A process (has port 1) on host A needs to communicate to another process: port 2 at host B
- The application layer on A hands the msg down to TCP with instructions to deliver it to (port2,host B)
- TCP hands msg down to IP with instructions to send it to host B:
 - The IP layer knows how to reach host B (or at least the first hop of the route) – does not care about port info
- IP hands down packets to network access (say Ethernet) with instructions to pass it to next router (first hop on the way to B)

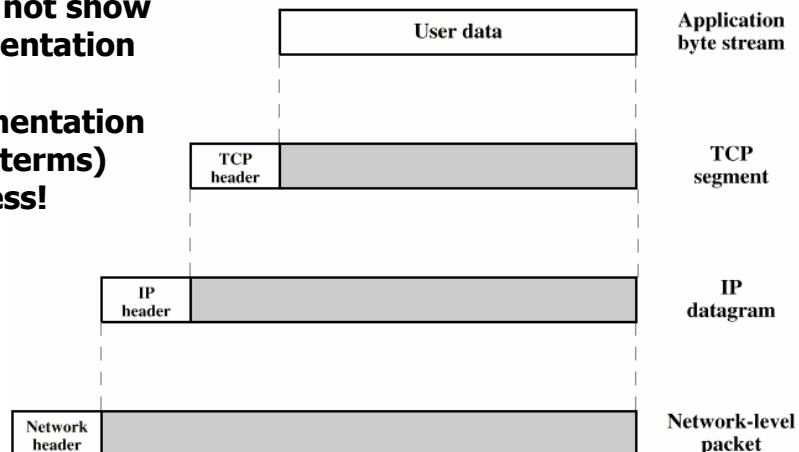

2/28/2009

Dr. Ashraf S. Hasan Mahmoud

30

Example of TCP/IP Communications

- Does not show segmentation (or fragmentation in IP terms) process!

2/28/2009

Dr. Ashraf S. Hasan Mahmoud

31

TCP/IP Control Information (Partial)

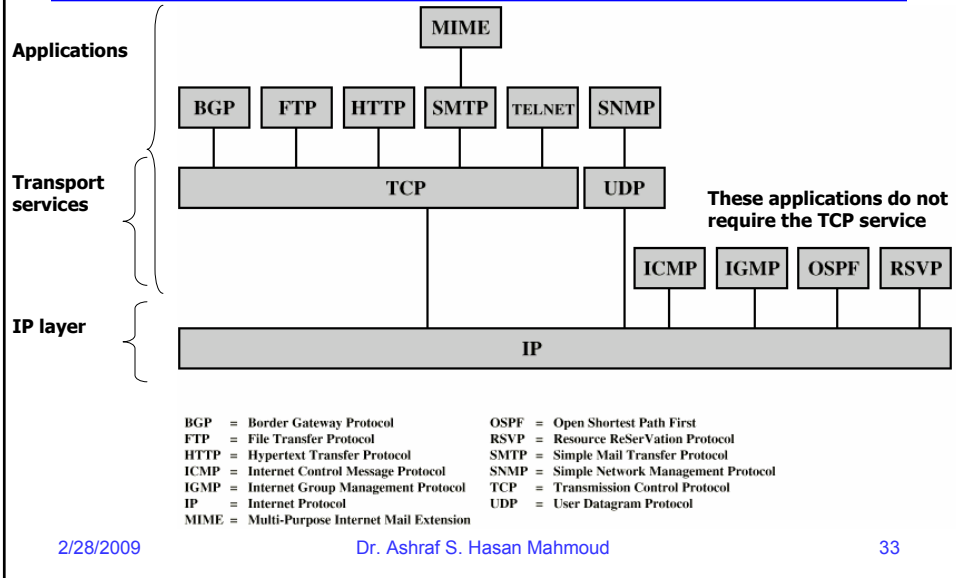

- **TCP control info:**
 - Destination port number
 - Sequence number
 - Checksum
- **IP control info:**
 - IP address
- **Network Access control info:**
 - Destination network access address (this is not the IP!!)
 - Facilities request (e.g. priorities)

2/28/2009

Dr. Ashraf S. Hasan Mahmoud

32

TCP/IP Control Information (Partial)
