1- Give three reasons (can be from the ones mentioned in the book) for assuming the Bell-LaPadula Model not preferred to be used for a bank security policy system ?

2- In the Biba's model example, what would be the effect of omitting the run-untrusted command? Do you think this enhances or degrades security ?

3- Describe briefly (in your words) the clinical information system security policy? What can be its main difference than the Chinese wall model?

4- In the originator controlled access control model, DAC and MAC features are involved in a combined way. Identify the combination three rules ?

5- What is the main feature of the following polices:
   a. Governmental security policy
   b. Industrial security policy
   c. Confidentiality policy
   d. Integrity policy
   e. Bell-LaPadula Model
   f. Biba Model
   g. Clark-Wilson Model
   h. Chinese Wall Model
   i. Clinical Information Systems Security Policy
   j. Originator Controlled Access Control
   k. Role-Based Access Control
