

Number Systems

COE 233

Digital Logic and Computer Organization

Dr. Muhamed Mudawar

King Fahd University of Petroleum and Minerals

Welcome to COE 233

❖ Course Webpage:

<https://faculty.kfupm.edu.sa/coe/mudawar/coe233/>

❖ Lecture Slides:

<https://faculty.kfupm.edu.sa/coe/mudawar/coe233/lectures/>

❖ Assignments:

<https://faculty.kfupm.edu.sa/coe/mudawar/coe233/exercises.htm>

❖ Blackboard:

<https://blackboard.kfupm.edu.sa/>

Which Book will be Used?

❖ Digital Design and Computer Architecture

❖ David Harris

❖ Sarah Harris

✧ Second Edition

✧ Morgan Kaufmann

✧ 2013

What will I Learn in this Course?

- ❖ Towards the end of this course, you should be able to:
 - ✧ Design small and medium scale logic circuits.
 - ✧ Describe the instruction set architecture of a processor, such as MIPS.
 - ✧ Design and implement MIPS Assembly Language programs.
 - ✧ Design a non-pipelined and simple pipelined processor.
 - ✧ Describe the organization and operation of memory and caches.
 - ✧ Analyze and evaluate the performance of processors and caches.

Grading Policy

❖ Assignments	15%
❖ Quizzes	15%
❖ Exam 1	20%
❖ Exam 2	20%
❖ Final Exam	30%

❖ **NO makeup exam** will be given

Presentation Outline

❖ Binary Numbers and Number Systems

❖ Number System Conversions

❖ Representing Fractions

❖ Binary Codes, Character Codes, ASCII

How do Computers Represent Digits?

- ❖ Binary digits (0 and 1) are the simplest to represent
- ❖ Using electric voltage
 - ✧ Used in digital circuits
 - ✧ High voltage = 1, Low voltage = 0
- ❖ Using electric charge
 - ✧ Used in memory cells
 - ✧ Charged memory cell = 1, discharged memory cell = 0
- ❖ Using magnetic field
 - ✧ Used in magnetic disks, magnetic polarity indicates 1 or 0
- ❖ Using light
 - ✧ Used in optical disks, optical lens can sense the light or not

Binary Numbers

- ❖ Each binary digit (called a bit) is either 1 or 0
- ❖ Bits have no inherent meaning, they can represent ...
 - ✧ Unsigned and signed integers
 - ✧ Fractions
 - ✧ Characters
 - ✧ Images, sound, etc.

❖ Bit Numbering

- ✧ Least significant bit (LSB) is rightmost (bit 0)
- ✧ Most significant bit (MSB) is leftmost (bit 7 in an 8-bit number)

Decimal Value of an Unsigned Integer

- ❖ Each bit represents a power of 2
- ❖ Every binary number is a sum of powers of 2
- ❖ Decimal Value = $(d_{n-1} \times 2^{n-1}) + \dots + (d_1 \times 2^1) + (d_0 \times 2^0)$
- ❖ Binary $(10011101)_2 = 2^7 + 2^4 + 2^3 + 2^2 + 1 = 157$

7	6	5	4	3	2	1	0
1	0	0	1	1	1	0	1
2^7	2^6	2^5	2^4	2^3	2^2	2^1	2^0

Some common
powers of 2

2^n	Decimal Value	2^n	Decimal Value
2^0	1	2^8	256
2^1	2	2^9	512
2^2	4	2^{10}	1024
2^3	8	2^{11}	2048
2^4	16	2^{12}	4096
2^5	32	2^{13}	8192
2^6	64	2^{14}	16384
2^7	128	2^{15}	32768

Positional Number Systems

Different Representations of Natural Numbers

XXVII Roman numerals (not positional)

27 Radix-10 or **decimal** number (positional)

11011_2 Radix-2 or **binary** number (also positional)

Fixed-radix positional representation with n digits

Number N in radix $r = (d_{n-1}d_{n-2} \dots d_1d_0)_r$

$$N_r \text{ Value} = d_{n-1} \times r^{n-1} + d_{n-2} \times r^{n-2} + \dots + d_1 \times r + d_0$$

$$\text{Examples: } (11011)_2 = 1 \times 2^4 + 1 \times 2^3 + 0 \times 2^2 + 1 \times 2 + 1 = 27$$

$$(2107)_8 = 2 \times 8^3 + 1 \times 8^2 + 0 \times 8 + 7 = 1095$$

Convert Decimal to Binary

- ❖ Repeatedly divide the decimal integer by 2
- ❖ Each remainder is a binary digit in the translated value
- ❖ Example: Convert 37_{10} to Binary

Division	Quotient	Remainder
$37 / 2$	18	1
$18 / 2$	9	0
$9 / 2$	4	1
$4 / 2$	2	0
$2 / 2$	1	0
$1 / 2$	0	1

← least significant bit

$$37 = (100101)_2$$

← most significant bit

← stop when quotient is zero

Decimal to Binary Conversion

- ❖ $N = (d_{n-1} \times 2^{n-1}) + \dots + (d_1 \times 2^1) + (d_0 \times 2^0)$
- ❖ Dividing N by 2 we first obtain
 - ✧ $\text{Quotient}_1 = (d_{n-1} \times 2^{n-2}) + \dots + (d_2 \times 2) + d_1$
 - ✧ $\text{Remainder}_1 = d_0$
 - ✧ Therefore, first remainder is least significant bit of binary number
- ❖ Dividing first quotient by 2 we first obtain
 - ✧ $\text{Quotient}_2 = (d_{n-1} \times 2^{n-3}) + \dots + (d_3 \times 2) + d_2$
 - ✧ $\text{Remainder}_2 = d_1$
- ❖ Repeat dividing quotient by 2
 - ✧ Stop when new quotient is equal to zero
 - ✧ Remainders are the bits from least to most significant bit

Popular Number Systems

❖ Binary Number System: Radix = 2

- ✧ Only two digit values: 0 and 1
- ✧ Numbers are represented as 0s and 1s

❖ Octal Number System: Radix = 8

- ✧ Eight digit values: 0, 1, 2, ..., 7

❖ Decimal Number System: Radix = 10

- ✧ Ten digit values: 0, 1, 2, ..., 9

❖ Hexadecimal Number Systems: Radix = 16

- ✧ Sixteen digit values: 0, 1, 2, ..., 9, A, B, ..., F
- ✧ A = 10, B = 11, ..., F = 15

❖ Octal and Hexadecimal numbers can be converted easily to Binary and vice versa

Octal and Hexadecimal Numbers

- ❖ Octal = Radix 8
- ❖ Only eight digits: 0 to 7
- ❖ Digits 8 and 9 not used
- ❖ Hexadecimal = Radix 16
- ❖ 16 digits: 0 to 9, A to F
- ❖ A=10, B=11, ..., F=15
- ❖ First 16 decimal values (0 to 15) and their values in binary, octal and hex.

Memorize table

Decimal Radix 10	Binary Radix 2	Octal Radix 8	Hex Radix 16
0	0000	0	0
1	0001	1	1
2	0010	2	2
3	0011	3	3
4	0100	4	4
5	0101	5	5
6	0110	6	6
7	0111	7	7
8	1000	10	8
9	1001	11	9
10	1010	12	A
11	1011	13	B
12	1100	14	C
13	1101	15	D
14	1110	16	E
15	1111	17	F

Binary, Octal, and Hexadecimal

- ❖ Binary, Octal, and Hexadecimal are related:

Radix 16 = 2^4 and Radix 8 = 2^3

- ❖ Hexadecimal digit = 4 bits and Octal digit = 3 bits
- ❖ Starting from least-significant bit, group each 4 bits into a hex digit or each 3 bits into an octal digit
- ❖ Example: Convert 32-bit number into octal and hex

<table><tr><td>3</td><td>5</td><td>3</td><td>0</td><td>5</td><td>5</td><td>2</td><td>3</td><td>6</td><td>2</td><td>4</td></tr></table>											3	5	3	0	5	5	2	3	6	2	4	Octal																			
3	5	3	0	5	5	2	3	6	2	4																															
<table><tr><td>1</td><td>1</td><td>1</td><td>0</td><td>1</td><td>0</td><td>1</td><td>1</td><td>0</td><td>0</td><td>0</td><td>1</td><td>0</td><td>1</td><td>1</td><td>0</td><td>1</td><td>0</td><td>0</td><td>1</td><td>1</td><td>1</td><td>1</td><td>0</td><td>0</td><td>1</td><td>0</td><td>1</td><td>0</td><td>0</td></tr></table>											1	1	1	0	1	0	1	1	0	0	0	1	0	1	1	0	1	0	0	1	1	1	1	0	0	1	0	1	0	0	32-bit binary
1	1	1	0	1	0	1	1	0	0	0	1	0	1	1	0	1	0	0	1	1	1	1	0	0	1	0	1	0	0												
<table><tr><td colspan="2">E</td><td colspan="2">B</td><td colspan="2">1</td><td colspan="2">6</td><td colspan="2">A</td><td colspan="2">7</td><td colspan="2">9</td><td colspan="2">4</td></tr></table>											E		B		1		6		A		7		9		4		Hexadecimal														
E		B		1		6		A		7		9		4																											

Converting Octal & Hex to Decimal

- ❖ Octal to Decimal: $N_8 = (d_{n-1} \times 8^{n-1}) + \dots + (d_1 \times 8) + d_0$
- ❖ Hex to Decimal: $N_{16} = (d_{n-1} \times 16^{n-1}) + \dots + (d_1 \times 16) + d_0$
- ❖ Examples:

$$(7204)_8 = (7 \times 8^3) + (2 \times 8^2) + (0 \times 8) + 4 = 3716$$

$$(3BA4)_{16} = (3 \times 16^3) + (11 \times 16^2) + (10 \times 16) + 4 = 15268$$

Converting Decimal to Hexadecimal

- ❖ Repeatedly divide the decimal integer by 16
- ❖ Each remainder is a hex digit in the translated value
- ❖ Example: convert 422 to hexadecimal

Division	Quotient	Remainder
422 / 16	26	6
26 / 16	1	A
1 / 16	0	1

← least significant digit

← most significant digit

$$422 = (1A6)_{16}$$

stop when
quotient is zero

- ❖ To convert decimal to octal divide by 8 instead of 16

Important Properties

- ❖ How many possible digits can we have in Radix r ?

r digits: 0 to $r - 1$

- ❖ What is the result of adding 1 to the largest digit in Radix r ?

Since digit r is not represented, result is $(10)_r$ in Radix r

Examples: $1_2 + 1 = (10)_2$ $7_8 + 1 = (10)_8$

$9_{10} + 1 = (10)_{10}$ $F_{16} + 1 = (10)_{16}$

- ❖ What is the largest value using 3 digits in Radix r ?

In binary: $(111)_2 = 2^3 - 1$

In octal: $(777)_8 = 8^3 - 1$

In decimal: $(999)_{10} = 10^3 - 1$

In Radix r :

largest value = $r^3 - 1$

Important Properties - cont'd

❖ How many possible values can be represented ...

Using n binary digits?

2^n values: 0 to $2^n - 1$

Using n octal digits

8^n values: 0 to $8^n - 1$

Using n decimal digits?

10^n values: 0 to $10^n - 1$

Using n hexadecimal digits

16^n values: 0 to $16^n - 1$

Using n digits in Radix r ?

r^n values: 0 to $r^n - 1$

Next . . .

- ❖ Binary Numbers and Number Systems
- ❖ Number System Conversions
- ❖ Representing Fractions
- ❖ Binary Codes, Character Codes, ASCII

Representing Fractions

❖ A number N_r in *radix* r can also have a fraction part:

$$N_r = \underbrace{d_{n-1} d_{n-2} \dots d_1 d_0}_{\text{Integer Part}} \cdot \underbrace{d_{-1} d_{-2} \dots d_{-m+1} d_{-m}}_{\text{Fraction Part}} \quad 0 \leq d_i < r$$

Radix Point

❖ The number N_r represents the value:

$$N_r = d_{n-1} \times r^{n-1} + \dots + d_1 \times r + d_0 + \quad \text{(Integer Part)}$$

$$d_{-1} \times r^{-1} + d_{-2} \times r^{-2} \dots + d_{-m} \times r^{-m} \quad \text{(Fraction Part)}$$

$$N_r = \sum_{i=0}^{i=n-1} d_i \times r^i + \sum_{j=-m}^{j=-1} d_j \times r^j$$

Examples of Numbers with Fractions

$$\diamond (2409.87)_{10} = 2 \times 10^3 + 4 \times 10^2 + 9 + 8 \times 10^{-1} + 7 \times 10^{-2}$$

$$\diamond (1101.1001)_2 = 2^3 + 2^2 + 2^0 + 2^{-1} + 2^{-4} = 13.5625$$

$$\diamond (703.64)_8 = 7 \times 8^2 + 3 + 6 \times 8^{-1} + 4 \times 8^{-2} = 451.8125$$

$$\diamond (A1F.8)_{16} = 10 \times 16^2 + 16 + 15 + 8 \times 16^{-1} = 2591.5$$

$$\diamond (423.1)_5 = 4 \times 5^2 + 2 \times 5 + 3 + 5^{-1} = 113.2$$

$$\diamond (263.5)_6$$

Digit 6 is NOT allowed in radix 6

Converting Decimal Fraction to Binary

- ❖ Convert $N = 0.6875$ to Radix 2
- ❖ Solution: **Multiply** N by 2 repeatedly & collect integer bits

Multiplication	New Fraction	Bit	
$0.6875 \times 2 = 1.375$	0.375	1	→ First fraction bit
$0.375 \times 2 = 0.75$	0.75	0	
$0.75 \times 2 = 1.5$	0.5	1	
$0.5 \times 2 = 1.0$	0.0	1	→ Last fraction bit

- ❖ Stop when new fraction = 0.0, or when enough fraction bits are obtained
- ❖ Therefore, $N = 0.6875 = (0.1011)_2$
- ❖ Check $(0.1011)_2 = 2^{-1} + 2^{-3} + 2^{-4} = 0.6875$

Converting Fraction to any Radix r

- ❖ To convert fraction N to any radix r

$$N_r = (0.d_{-1} d_{-2} \dots d_{-m})_r = d_{-1} \times r^{-1} + d_{-2} \times r^{-2} \dots + d_{-m} \times r^{-m}$$

- ❖ Multiply N by r to obtain d_{-1}

$$N_r \times r = \textcolor{red}{d}_{-1} + d_{-2} \times r^{-1} \dots + d_{-m} \times r^{-m+1}$$

- ❖ The integer part is the digit $\textcolor{red}{d}_{-1}$ in radix r

- ❖ The new fraction is $d_{-2} \times r^{-1} \dots + d_{-m} \times r^{-m+1}$

- ❖ Repeat multiplying the new fractions by r to obtain $\textcolor{red}{d}_{-2} \textcolor{red}{d}_{-3} \dots$

- ❖ Stop when new fraction becomes 0.0 or enough fraction digits are obtained

More Conversion Examples

- ❖ Convert $N = 139.6875$ to Octal (Radix 8)
- ❖ Solution: $N = 139 + 0.6875$ (split integer from fraction)
- ❖ The integer and fraction parts are converted separately

Division	Quotient	Remainder
139 / 8	17	3
17 / 8	2	1
2 / 8	0	2

Multiplication	New Fraction	Digit
$0.6875 \times 8 = 5.5$	0.5	5
$0.5 \times 8 = 4.0$	0.0	4

- ❖ Therefore, $139 = (213)_8$ and $0.6875 = (0.54)_8$
- ❖ Now, join the integer and fraction parts with radix point
 $N = 139.6875 = (213.54)_8$

Conversion Procedure to Radix r

- ❖ To convert decimal number N (with fraction) to radix r
- ❖ Convert the Integer Part
 - ✧ Repeatedly divide the integer part of number N by the radix r and **save the remainders**. The integer digits in radix r are the remainders in **reverse order** of their computation. If radix $r > 10$, then convert all remainders > 10 to digits A, B, ... etc.
- ❖ Convert the Fractional Part
 - ✧ Repeatedly multiply the fraction of N by the radix r and **save the integer digits** that result. The fraction digits in radix r are the integer digits in **order of their computation**. If the radix $r > 10$, then convert all digits > 10 to A, B, ... etc.
- ❖ Join the result together with the radix point

Important Properties of Fractions

- ❖ How many fractional values exist with m fraction bits?

2^m fractions, because each fraction bit can be 0 or 1

- ❖ What is the largest fraction value if m bits are used?

Largest fraction value = $2^{-1} + 2^{-2} + \dots + 2^{-m} = 1 - 2^{-m}$

Because if you add 2^{-m} to largest fraction you obtain 1

- ❖ In general, what is the largest fraction value if m fraction digits are used in radix r ?

Largest fraction value = $(r - 1) \times (r^{-1} + r^{-2} + \dots + r^{-m}) = 1 - r^{-m}$

For decimal, largest fraction value = $1 - 10^{-m}$

For hexadecimal, largest fraction value = $1 - 16^{-m}$

Next . . .

- ❖ Binary Numbers and Number Systems
- ❖ Number System Conversions
- ❖ Representing Fractions
- ❖ Binary Codes, Character Codes, ASCII

Binary Codes

- ❖ How to represent characters, colors, etc?
- ❖ Define the set of all **represented elements**
- ❖ Assign a unique binary code to each element of the set
- ❖ Given n bits, a **binary code** is a mapping from the set of elements to a subset of the 2^n binary numbers
- ❖ Coding Numeric Data (example: coding decimal digits)
 - ✧ Coding must simplify common arithmetic operations
 - ✧ Tight relation to binary numbers
- ❖ Coding Non-Numeric Data (example: coding colors)
 - ✧ More flexible codes since arithmetic operations are not applied

Example of Coding Non-Numeric Data

- ❖ Suppose we want to code 7 colors of the rainbow
- ❖ As a minimum, we need 3 bits to define 7 unique values
- ❖ 3 bits define 8 possible combinations
- ❖ Only 7 combinations are needed
- ❖ Code 000 is not used
- ❖ Other assignments are also possible

Color	3-bit code
Red	001
Orange	010
Yellow	011
Green	100
Blue	101
Indigo	110
Violet	111

Minimum Number of Bits for Coding

- ❖ Given a set of M elements to be represented by a binary code, the **minimum number of bits**, n , should satisfy:

$$2^{(n-1)} < M \leq 2^n$$

$n = \lceil \log_2 M \rceil$ where $\lceil x \rceil$, called the **ceiling function**, is the smallest integer greater than or equal to x

- ❖ How many bits are required to represent 128 characters with a binary code?
- ❖ **Answer:** $\lceil \log_2 128 \rceil = 7$ bits are used to code 128 characters

Character Codes

❖ Character sets

- ✧ Standard ASCII: 7-bit character codes (0 – 127)
- ✧ Extended ASCII: 8-bit character codes (0 – 255)
- ✧ Unicode: 16-bit character codes (0 – 65,535)
- ✧ Unicode standard represents a universal character set
 - Defines codes for characters used in all major languages
 - Each character is encoded as 16 bits
- ✧ UTF-8: variable-length encoding used in HTML
 - Encodes all Unicode characters
 - Uses 1 byte for ASCII, but multiple bytes for other characters

❖ Null-terminated String

- ✧ Array of characters followed by a NULL character

Printable ASCII Codes

	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F
2	space	!	"	#	\$	%	&	'	()	*	+	,	-	.	/
3	0	1	2	3	4	5	6	7	8	9	:	;	<	=	>	?
4	@	A	B	C	D	E	F	G	H	I	J	K	L	M	N	O
5	P	Q	R	S	T	U	V	W	X	Y	Z	[\]	^	_
6	`	a	b	c	d	e	f	g	h	i	j	k	l	m	n	o
7	p	q	r	s	t	u	v	w	x	y	z	{		}	~	DEL

❖ Examples:

- ✧ ASCII code for space character = 20 (hex) = 32 (decimal)
- ✧ ASCII code for 'L' = 4C (hex) = 76 (decimal)
- ✧ ASCII code for 'a' = 61 (hex) = 97 (decimal)

Control Characters

- ❖ The first 32 characters of ASCII table are used for control
- ❖ Control character codes = 00 to 1F (hexadecimal)
 - ✧ Not shown in previous slide
- ❖ Examples of Control Characters
 - ✧ Character 0 is the **NULL** character \Rightarrow used to terminate a string
 - ✧ Character 9 is the **Horizontal Tab (HT)** character
 - ✧ Character 0A (hex) = 10 (decimal) is the **Line Feed (LF)**
 - ✧ Character 0D (hex) = 13 (decimal) is the **Carriage Return (CR)**
 - ✧ The LF and CR characters are used together
 - They advance the cursor to the beginning of next line
- ❖ One control character appears at end of ASCII table
 - ✧ Character 7F (hex) is the **Delete (DEL)** character
