

# Performance

COE 501

Computer Architecture

Prof. Muhamed Mudawar

Computer Engineering Department

King Fahd University of Petroleum and Minerals

# What is Performance?

- ❖ How do we measure the performance of a computer?
- ❖ A user of a computer system may say:
  - ✧ A computer is faster when a program runs in **less time**
- ❖ A server administrator may say:
  - ✧ A computer is faster if it completes **more transactions per minute**
- ❖ What factors are hardware related?
- ❖ What factors are software related?

# Time as a Measure of Performance

## ❖ Response Time

- ✧ Time between start and completion of a task
- ✧ As observed and measured by the end user
- ✧ Called also **Wall-Clock Time** or **Elapsed Time**
- ✧  $\text{Response Time} = \text{CPU Time} + \text{Waiting Time (I/O, scheduling, etc.)}$

## ❖ CPU Execution Time

- ✧ Time spent executing the program instructions
- ✧ **CPU time = User CPU time + Kernel CPU time**
- ✧ Can be measured in seconds, msec,  $\mu\text{sec}$ , etc.
- ✧ Can be related to the **number of CPU clock cycles**

# Throughput as a Performance Metric

## ❖ **Throughput = Total work done per unit of time**

- ✧ Tasks per hour
- ✧ Transactions per minute

## ❖ Decreasing the execution time improves throughput

- ✧ Example: using a faster version of a processor
- ✧ Less time to run a task  $\Rightarrow$  more tasks can be executed per unit of time

## ❖ Parallel hardware improves throughput and response time

- ✧ By increasing the number of processors in a multiprocessor
- ✧ More tasks can be executed in parallel
- ✧ Execution time of individual sequential tasks is not changed
- ✧ Less waiting time in queues reduces (improves) response time

# Relative Performance

- ❖ For some program running on computer  $X$

$$\text{Performance}_X = \frac{1}{\text{Execution time}_X}$$

- ❖ Computer  $X$  is  $n$  times faster than  $Y$

$$\frac{\text{Performance}_X}{\text{Performance}_Y} = \frac{\text{Execution time}_Y}{\text{Execution time}_X} = n$$

- ❖ Example: A program takes 10 sec on A and 15 sec on B

Which computer is faster and by what factor?

Computer A is faster than B by a factor =  $15/10 = 1.5$

# Processor Performance Equation

$$\text{CPU Time (sec)} = \frac{\text{Instructions}}{\text{Program}} \times \frac{\text{Cycles}}{\text{Instruction}} \times \frac{\text{Seconds}}{\text{Cycle}}$$

|              | Instruction Count | CPI | Clock Cycle |
|--------------|-------------------|-----|-------------|
| Program      | X                 |     |             |
| Compiler     | X                 | X   |             |
| ISA          | X                 | X   |             |
| Organization |                   | X   | X           |
| Technology   |                   |     | X           |

# Determining the Clock Cycle

## ❖ Sum of circuit element delays

- ❖ Register clock-to-output delay + register setup time
- ❖ Combinational Logic delay along longest (critical) path
- ❖ Wire delays
- ❖ Clock skew

**Clock cycle should be long enough to ensure correct timing of writes**

# CPI: Clock cycles Per Instruction

$$\text{Average CPI for a given program} = \frac{\text{Total CPU clock cycles}}{\text{Total Instruction Count}}$$

❖ Different instructions have different CPI

Let  $\text{CPI}_i$  = clocks per instruction for class  $i$  of instructions

Let  $C_i$  = instruction count for class  $i$  of instructions

$$\text{CPU cycles} = \sum_{i=1}^n (\text{CPI}_i \times C_i)$$

$$\text{CPI} = \frac{\sum_{i=1}^n (\text{CPI}_i \times C_i)}{\sum_{i=1}^n C_i}$$

❖ Obtain CPI by detailed simulation

❖ Use hardware counters in a CPU

# Example 1 on CPI

Given the following instruction mix of a program on a processor

What is the average CPI?

What is the percent of time used by each instruction class?

| <b>Class<sub>i</sub></b> | <b>Freq<sub>i</sub></b> | <b>CPI<sub>i</sub></b> | <b>Freq<sub>i</sub> × CPI<sub>i</sub></b> | <b>Percent of Time</b> |
|--------------------------|-------------------------|------------------------|-------------------------------------------|------------------------|
| ALU                      | 20%                     | 1                      | $0.2 \times 1 = 0.2$                      | $0.2 / 3.1 = 6.4\%$    |
| FPU                      | 30%                     | 4                      | $0.3 \times 4 = 1.2$                      | $1.2 / 3.1 = 38.7\%$   |
| Load                     | 20%                     | 5                      | $0.2 \times 5 = 1.0$                      | $1.0 / 3.1 = 32.3\%$   |
| Store                    | 10%                     | 3                      | $0.1 \times 3 = 0.3$                      | $0.3 / 3.1 = 9.7\%$    |
| Branch                   | 20%                     | 2                      | $0.2 \times 2 = 0.4$                      | $0.4 / 3.1 = 12.9\%$   |

**Average CPI** =  $0.2 + 1.2 + 1.0 + 0.3 + 0.4 = 3.1$

# Example 2 on CPI

❖ Suppose we make the following measurements:

✧ Frequency of **ALL** FP ops (including SQRT) = 30%, with average CPI = 4.0

✧ Frequency of SQRT only = 2%, with CPI of SQRT = 10

❖ What is the average CPI of FP operations excluding SQRT?

❖ **Answer:** Frequency of FP ops – SQRT = 30% – 2% = 28%

$$\text{CPI of ALL FP} = \frac{0.02 \times \text{CPI SQRT} + 0.28 \times \text{CPI FP excluding SQRT}}{0.3}$$

$$4.0 = \frac{0.02 \times 10 + 0.28 \times \text{CPI of FP ops excluding SQRT}}{0.3}$$

$$\text{CPI of FP ops excluding SQRT} = \frac{4.0 \times 0.3 - 0.02 \times 10}{0.28} = 3.57$$

# MIPS as a Performance Measure

- ❖ MIPS: Millions Instructions Per Second (execution rate)
- ❖ Used as a performance metric
  - ✧ Faster machine  $\Rightarrow$  larger MIPS
- ❖ MIPS specifies instruction execution rate

$$\text{MIPS} = \frac{\text{Instruction Count}}{\text{Execution Time} \times 10^6} = \frac{\text{Clock Rate}}{\text{CPI} \times 10^6}$$

- ❖ We can also relate execution time to MIPS

$$\text{Execution Time} = \frac{\text{Inst Count}}{\text{MIPS} \times 10^6} = \frac{\text{Inst Count} \times \text{CPI}}{\text{Clock Rate}}$$

# Drawbacks of MIPS

Three problems using MIPS as a performance metric

1. Does not take into account the capability of instructions

- ✧ Cannot use MIPS to compare computers with different instruction sets because the instruction count will differ

2. MIPS varies between programs on the same computer

- ✧ A computer cannot have a single MIPS rating for all programs

3. MIPS can vary inversely with performance

- ✧ A higher MIPS rating does not always mean better performance
- ✧ Example in next slide shows this anomalous behavior

# MIPS Example

❖ Consider the following performance measurements

| Measurement                           | Computer A | Computer B |
|---------------------------------------|------------|------------|
| Instruction Count for a given program | 10 Billion | 8 Billion  |
| Clock Rate                            | 4.2 GHz    | 4.0 GHz    |
| CPI                                   | 1.0        | 1.1        |

✧ Which computer has the higher MIPS rating? Which is faster?

❖ Answer

✧  $\text{MIPS (Computer A)} = (4.2 \times 10^9) / (1.0 \times 10^6) = 4200 \text{ MIPS}$

✧  $\text{MIPS (Computer B)} = (4.0 \times 10^9) / (1.1 \times 10^6) = 3636 \text{ MIPS}$

✧  $\text{CPU Time (A)} = (10 \times 10^9 \times 1.0) / (4.2 \times 10^9) = 2.38 \text{ sec}$

✧  $\text{CPU Time (B)} = (8 \times 10^9 \times 1.1) / (4 \times 10^9) = 2.20 \text{ sec}$

✧ Computer A has a higher MIPS rating, but B has less execution time

# Amdahl's Law

## ❖ Amdahl's Law is a measure of Speedup

✧ How a program performs after improving some portion of a computer

$$\text{Speedup} = \frac{\text{Execution time of the program without using the enhancement}}{\text{Execution time of the program using the enhancement}}$$

❖ Let **f** = Fraction of the computation time that is enhanced

❖ Let **s** = Speedup factor of the enhancement only

|                               |                                              |       |
|-------------------------------|----------------------------------------------|-------|
| Execution Time <sub>old</sub> | Fraction <b>f</b> of old time to be enhanced | 1 - f |
| Execution Time <sub>new</sub> | <b>f / s</b> of old time                     | 1 - f |

$$\text{Speedup} = \frac{\text{Execution Time}_{\text{old}}}{\text{Execution Time}_{\text{new}}} = \frac{1}{((1 - f) + f / s)}$$

# Example on Amdahl's Law

- ❖ Suppose that floating-point square root is responsible for 20% of the execution time of a graphics benchmark and ALL FP instructions are responsible for 60%
- ❖ One proposal is to speedup FP SQRT by a factor of 10
- ❖ Alternative choice: make ALL FP instructions 2X faster, which choice is better?
- ❖ Answer:
  - ✧ Choice 1: Improve FP SQRT by a factor of 10
  - ✧ Speedup (FP SQRT) =  $1/(0.8 + 0.2/10) = 1.22$
  - ✧ Choice 2: Improve ALL FP instructions by a factor of 2
  - ✧ Speedup =  $1/(0.4 + 0.6/2) = 1.43 \rightarrow \text{Better}$

# Amdahl's Law of Diminishing Return

- ❖ Overall speedup gained by just improving a portion of the computer diminishes as improvements are added

$$\text{Speedup}_{\text{overall}} = \frac{1}{((1 - f) + f / s)} \rightarrow \frac{1}{(1 - f)} \text{ as } s \rightarrow \infty$$

- ❖ Example: A program spends 80% of its time running on a processor and 20% of its time waiting for I/O. What is the overall speedup if we run the computation on a 10X faster processor? or on a 100X faster processor?
- ❖ Speedup (10X processor) =  $1/(0.2+0.8/10) = 3.57 \text{ X}$
- ❖ Speedup (100X processor) =  $1/(0.2+0.8/100) = 4.81 \text{ X}$
- ❖ Overall speedup **cannot exceed 5X** because of I/O

# Latency versus Bandwidth

- ❖ Latency = **Elapsed time for a single event**
  - ✧ Example: DRAM memory access time in nanoseconds
- ❖ Bandwidth = **Number of events per unit time**
  - ✧ Example: Mbytes per second from DRAM memory
- ❖ Tracking Four Technology Improvements
  - ✧ DRAM Memory (1980 – 2016)
  - ✧ Processors (1982 – 2017)
  - ✧ Disk Storage (1983 – 2016)
  - ✧ Local Area Network (Ethernet 1978 – 2017)

# DRAM Memory Improvements

| Year                   | 1980    | 1986      | 1993      | 1997    | 2000     | 2010    | 2016    |
|------------------------|---------|-----------|-----------|---------|----------|---------|---------|
| Type                   | DRAM    | Fast Page | Fast Page | SDRAM   | DDR      | DDR3    | DDR4    |
| Capacity               | 64 Kbit | 1 Mbit    | 16 Mbit   | 64 Mbit | 256 Mbit | 2048 Mb | 4096 Mb |
| Die (mm <sup>2</sup> ) | 35      | 70        | 130       | 170     | 204      | 50      | 50      |
| Pins / Chip            | 16      | 18        | 20        | 54      | 66       | 96      | 134     |
| Bandwidth              | 13 MB/s | 160       | 267       | 640     | 1600     | 16,000  | 27,000  |
| Latency                | 225 ns  | 125 ns    | 75 ns     | 62 ns   | 52 ns    | 37 ns   | 30 ns   |

- ❖ Capacity Improvements =  $4096 / 0.064 = 64,000 \times$
- ❖ Bandwidth Improvements =  $27000 / 13 = 2077 \times$
- ❖ Latency Improvements =  $225 / 30 = 7.5 \times$
- ❖ Bandwidth Improvements  $\gg$  Latency Improvements

# Microprocessor Improvements

| Year                   | 1982      | 1985      | 1989      | 1993    | 2001      | 2010    | 2017    |
|------------------------|-----------|-----------|-----------|---------|-----------|---------|---------|

| Pins/chip              | 68        | 132       | 168       | 273     | 423       | 1366    | 1400    |
| Bus width              | 16 bits   | 32        | 32        | 64      | 64        | 3×64    | 3×64    |
| Cores/chip             | 1         | 1         | 1         | 1       | 1         | 4       | 4       |
| Clock MHz              | 12.5      | 16        | 25        | 66      | 1500      | 3333    | 4000    |
| MIPS                   | 2         | 6         | 25        | 132     | 4500      | 50,000  | 64,000  |
| Latency                | 320 ns    | 313 ns    | 200 ns    | 76 ns   | 15 ns     | 4 ns    | 4 ns    |

❖ Bandwidth Improvements (MIPS) =  $64000 / 2 = 32,000 \times$

❖ Latency Improvements =  $320 / 4 = 80 \times$

# Hard Disk Improvements

| Year      | 1983     | 1990    | 1994    | 1998    | 2003    | 2010     | 2016     |
|-----------|----------|---------|---------|---------|---------|----------|----------|
| RPM       | 3600     | 5400    | 7200    | 10,000  | 15,000  | 15,000   | 15,000   |
| Capacity  | 0.03 GB  | 1.4 GB  | 4.3 GB  | 9.1 GB  | 73.4 GB | 600 GB   | 600 GB   |
| Diameter  | 5.25"    | 5.25"   | 3.5"    | 3.0"    | 2.5"    | 2.5"     | 2.5"     |
| Bandwidth | 0.6 MB/s | 4 MB/s  | 9 MB/s  | 24 MB/s | 86 MB/s | 204 MB/s | 250 MB/s |
| Latency   | 48.3 ms  | 17.1 ms | 12.7 ms | 8.8 ms  | 5.7 ms  | 3.6 ms   | 3.6 ms   |

- ❖ RPM Improvements =  $15000 / 3600 = 4.2 \times$
- ❖ Capacity Improvements =  $600 / 0.03 = 20,000 \times$
- ❖ Bandwidth Improvements =  $250 / 0.6 = 417 \times$
- ❖ Latency Improvements =  $48.3 / 3.6 = 13.4 \times$
- ❖ Bandwidth Improvements  $\gg$  Latency Improvements

# Local Area Network Improvements

| Year      | 1978         | 1995        | 1999        | 2003        | 2010        | 2017        |
|-----------|--------------|-------------|-------------|-------------|-------------|-------------|
| LAN       | Ethernet     | Fast        | Gigabit     | 10 Gigabit  | 100 Gigabit | 400 Gigabit |
| Standard  | 802.3        | 803.3u      | 802.3ab     | 802.3ac     | 802.3ba     | 802.3bs     |
| Bandwidth | 10 Mbit/s    | 100 Mb/s    | 1 Gbit/s    | 10 Gbit/s   | 100 Gbit/s  | 400 Gbit/s  |
| Latency   | 3000 $\mu$ s | 500 $\mu$ s | 340 $\mu$ s | 190 $\mu$ s | 100 $\mu$ s | 60 $\mu$ s  |

- ❖ Bandwidth Improvements =  $400 / 0.01 = 40,000 \times$
- ❖ Latency Improvements =  $3000 / 60 = 50 \times$
- ❖ Bandwidth Improvements  $\gg$  Latency Improvements

# Bandwidth versus Latency Improvements

Copyright © 2019, Elsevier Inc.

# Five Reasons Latency Lags Bandwidth

1. Moore's Law helps Bandwidth more than Latency
  - ✧ Smaller, faster, more transistors, more I/O pins help bandwidth
  - ✧ Wire delay does not improve with smaller feature size
2. Distance increases latency
  - ✧ Relatively long wires in DRAM limit latency
3. Bandwidth easier to sell (Bigger is Better)
  - ✧ 100 Gigabits per second versus 100  $\mu$ sec latency for Ethernet
4. Latency helps Bandwidth, but not vice versa
  - ✧ Lower DRAM latency → more DRAM access/sec (bandwidth)
5. OS overhead hurts Latency more than Bandwidth
  - ✧ Scheduling queues help bandwidth but hurt latency

# Benchmarks

- ❖ Performance is measured by running real applications
  - ✧ Use programs typical of expected workload
  - ✧ Representatives of expected classes of applications
  - ✧ Examples: compilers, editors, scientific applications, graphics, ...
- ❖ SPEC (System Performance Evaluation Corporation)
  - ✧ Website: [www.spec.org](http://www.spec.org)
  - ✧ Various benchmarks for CPU performance, graphics, high-performance computing, Web servers, etc.
  - ✧ Specifies rules for running list of programs and reporting results
  - ✧ Valuable indicator of performance (and compiler technology)
  - ✧ SPEC CPU 2017 (10 integer + 13 FP programs in C, C++, and Fortran)

Benchmarks measure CPU time, because of little I/O. Wall clock time is used as a performance metric

# Summarizing Performance Results

$$SPEC\ Ratio = \frac{Time\ on\ Reference\ Computer}{Time\ of\ Computer\ being\ Rated}$$

$$\frac{SPEC\ Ratio\ A}{SPEC\ Ratio\ B} = \frac{\frac{Reference\ Execution\ Time}{Execution\ Time\ A}}{\frac{Reference\ Execution\ Time}{Execution\ Time\ B}} = \frac{Execution\ Time\ B}{Execution\ Time\ A}$$

$$Geometric\ Mean = \sqrt[n]{\prod_{i=1}^n SPEC\ Ratio}$$

**Choice of Reference Computer is Irrelevant**

**Geometric mean of ratios = 2.00 = Ratio of Geometric means = 63.72 / 31.91**

# Things to Remember about Performance

- ❖ Two common measures: Response Time and Throughput
- ❖ CPU Execution Time = Instruction Count  $\times$  CPI  $\times$  Cycle
- ❖ MIPS = Millions of Instructions Per Second (is a rate)
  - ✧ FLOPS = Floating-point Operations Per Second
- ❖ Latency is the time of a single event, Bandwidth is a rate
  - ✧ Latency improvements lag Bandwidth over the past 30 years
- ❖ Amdahl's Law is a measure of speedup
  - ✧ When improving part of a computer (fraction of execution time)
- ❖ Benchmarks: real applications are used
  - ✧ To compare the performance of computer systems
  - ✧ Geometric mean of SPEC ratios (for a set of applications)
