

Q1

M2-112-10

A point charge $q = -1.0 \times 10^{-10}$ C is placed at the center of a spherical conducting shell that has a total charge $Q = 5.0 \times 10^{-10}$ C, as shown in the figure. The outer surface has radius $R_2 = 10$ cm. The charge density on the external surface is equal to

- A) $+3.2$ nC/m²
- B) -3.2 nC/m²
- C) $+4.0$ nC/m²
- D) $+0.80$ nC/m²
- E) -0.80 nC/m²

Net charge in a cavity
totally within a conductor is zero

$$\Rightarrow q_{in} + q = 0$$

$$\Rightarrow q_{in} = -q = +1 \times 10^{-10} \text{ C}$$

From conservation of charge, the total charge of the spherical conductor cannot change

$$\Rightarrow q_{out} + q_{in} = 5 \times 10^{-10} \text{ C}$$

$$\Rightarrow q_{out} = 4 \times 10^{-10} \text{ C}$$

$$\Rightarrow \text{The charge density on the external surface} \\ = \frac{q_{out}}{4\pi R_2^2} = \frac{4 \times 10^{-10}}{4\pi (0.1)^2} = 3.2 \times 10^{-9} \text{ C/m}^2 = 3.2 \text{ nC/m}^2$$

Q2

M2-142-6

The figure shows a pyramid with horizontal square base, $a = 6.00$ m on each side, and a height, $h = 4.00$ m. The pyramid is placed in an upward vertical electric field of magnitude $E = 52.0$ N/C. If the pyramid does not include any charge inside, calculate the electric flux, in $\text{N}\cdot\text{m}^2/\text{C}$, through its four slanted (inclined) surfaces.

- A) $+1.87 \times 10^3$
- B) -1.87×10^3
- C) $+0.9 \times 10^3$
- D) -0.9×10^3
- E) -3.27×10^3

Gauss' Law $\epsilon_0 \Phi = q_{\text{enc}}$

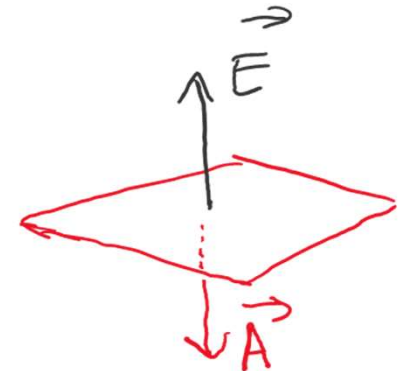

Since $q_{\text{enc}} = 0 \Rightarrow \Phi = 0$

$$\Phi_{\text{base}} + \Phi_{\text{sides}} = 0$$

$$\Phi_{\text{base}} = \vec{E} \cdot \vec{A} = EA \cos 180 = -Ea^2$$

$$\Rightarrow \Phi_{\text{sides}} = -\Phi_{\text{base}} = Ea^2 = 52(6)^2 \frac{\text{Nm}^2}{\text{C}}$$

$$\Phi_{\text{sides}} = +1.87 \times 10^3 \frac{\text{Nm}^2}{\text{C}}$$

Q3

M2-112-8

Consider three infinite non-conducting sheets with uniform charge densities $(-\sigma, +2\sigma, +3\sigma)$, as shown in cross section in the figure. The electric field between plates A and B is given by

- A) $\frac{3\sigma}{\epsilon_0}$ to the left
- B) $\frac{6\sigma}{\epsilon_0}$ to the left
- C) $\frac{3\sigma}{\epsilon_0}$ to the right
- D) $\frac{6\sigma}{\epsilon_0}$ to the right
- E) $\frac{\sigma}{\epsilon_0}$ to the right

total = $\frac{6\sigma}{2\epsilon_0} = \frac{3\sigma}{\epsilon_0}$ to the left.

Q4

M2-132-9

The figure shows the cross sectional area of two identical charged solid spheres, 1 and 2, of radius R . The charge is uniformly distributed throughout the volumes of both the spheres. The net electric field is zero at point P, which is located on a line connecting the centers of the spheres, at radial distance $R/2$ from the center of sphere 1. If the charge on sphere 1 is $q_1 = 7.8 \mu\text{C}$, determine the magnitude of the charge q_2 on sphere 2.

- A) $8.8 \mu\text{C}$
- B) $3.2 \mu\text{C}$
- C) $9.3 \mu\text{C}$
- D) $3.5 \mu\text{C}$
- E) $6.8 \mu\text{C}$

$$\frac{r_2 > R}{E_2 = \frac{kq_2}{r_2^2} = \frac{kq_2}{(R + \frac{R}{2})^2}}$$

$$\frac{r_1 < R}{E_1 = \frac{kq_1}{R^3} r_1 = \frac{kq_1}{R^3} (\frac{R}{2})}$$

$$E_2 = E_1 \Rightarrow \frac{kq_2}{(R + \frac{R}{2})^2} = \frac{kq_1}{R^3} \frac{R}{2}$$

$$\Rightarrow \frac{q_2}{(\frac{3}{2})^2} = \frac{q_1}{2} \Rightarrow q_2 = \frac{9}{8} q_1 = 8.8 \mu\text{C}$$

Q5

M2-122-8

A long, straight wire has fixed negative charge with a linear charge density of magnitude 4.5 nC/m . The wire is enclosed by a coaxial, thin walled nonconducting cylindrical shell of radius 20 cm . The shell is to have a positive charge on its outside surface (with a surface charge density σ) that makes the net electric field at points 30 cm from the center of the shell equal to zero. Calculate σ .

- A) $3.6 \times 10^{-9} \text{ C/m}^2$
- B) $3.0 \times 10^{-10} \text{ C/m}^2$
- C) $1.5 \times 10^{-10} \text{ C/m}^2$
- D) $4.5 \times 10^{-7} \text{ C/m}^2$
- E) $7.8 \times 10^{-5} \text{ C/m}^2$

Since the point P is outside the cylindrical shell, we can treat the shell as another wire located at the same position of the real wire.

$$E_s = E_w$$

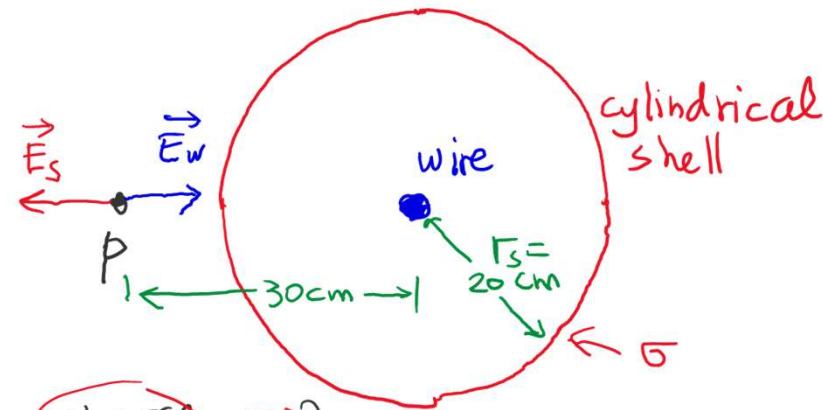

$$\Rightarrow \frac{\lambda_s}{2\pi\epsilon_0 r} = \frac{\lambda_w}{2\pi\epsilon_0 r}$$

$$\Rightarrow \lambda_s = \lambda_w$$

$$\lambda_s = \frac{\text{charge}}{\text{length}}$$

$$\sigma = \frac{\text{charge}}{\text{area}} = \frac{\text{charge}}{2\pi r_s l} = \frac{\lambda_s}{2\pi r_s}$$

$$\sigma = \frac{\lambda_w}{2\pi r_s} = \frac{4.5 \text{ nC}}{2\pi(0.2) \text{ m}^2} = 3.6 \times 10^{-9} \frac{\text{C}}{\text{m}^2}$$

Q6

M2-132-7

Consider two infinitely long thin wires carrying uniform linear charge densities λ_1 and λ_2 . The wires are arranged as shown in the figure and $\lambda_2 = +5.50$ nC/m. If the net electric field at P is zero, determine the magnitude of λ_1 .

- A) 2.75 nC/m
- B) 1.50 nC/m
- C) 1.75 nC/m
- D) 2.00 nC/m
- E) 0.50 nC/m

$$E_1 = \frac{|\lambda_1|}{2\pi\epsilon_0 r_1}$$

$$E_2 = \frac{|\lambda_2|}{2\pi\epsilon_0 r_2}$$

$$E_1 = E_2 \Rightarrow \frac{|\lambda_1|}{r_1} = \frac{|\lambda_2|}{r_2}$$

$$\Rightarrow |\lambda_1| = \frac{r_1}{r_2} |\lambda_2| = \frac{0.02}{0.04} 5.5 \frac{\text{nC}}{\text{m}} = 2.75 \frac{\text{nC}}{\text{m}}$$
